3-Heights® PDF Security Shell

Version 6.27.6

Contents

1	Introduction	6
1.1	Description	6
1.2	Functions	6
1.2.1	Features	7
1.2.2	Formats	8
1.2.3	Conformance	8
1.3	Operating systems	8
1.4	Digital signatures	9
1.4.1	Overview	9
1.4.2	Terminology	9
1.4.3	Why digitally signing?	9
1.4.4	What is an electronic signature?	10
	Simple electronic signature	10
	Advanced electronic signature	11
	Qualified electronic signature	11
1.4.5	Creating electronic signatures	12
	Preparation steps	12
	Application of the signature	12
2	Installation	14
2.1	Windows	14
2.1.1	How to set the environment variable "Path"	14
2.2	Linux and macOS	15
2.2.1	Linux	15
2.3	Uninstall	16
2.4	Note about the evaluation license	16
2.5	Special directories	16
2.5.1	Directory for temporary files	16
2.5.2	Cache directory	16
2.5.3	Font directories	17
3	License management	18
3.1	License features	18
4	Getting started	19
4.1	Basics	19
4.1.1	Usage	19
4.2	Specify the folder of the output file	19
4.3	Encryption	19
4.3.1	Encryption and how it works in PDF	19
4.3.2	Owner password and user password	19
4.3.3	Permission flags	20
4.3.4	Encrypting a PDF document	20
4.3.5	Reading an encrypted PDF document	21
4.3.6	How secure is PDF encryption?	21
4.3.7	Setting permission flags for Acrobat	21
4.4	Cryptographic provider	22
4.4.1	PKCS#11 provider	23
	Configuration	23

	Interoperability support	23
	Selecting a certificate for signing	24
	Using PKCS#11 stores with missing issuer certificates	24
	PKCS#11 devices that contain private keys only	24
4.4.2	Cryptographic suites	25
4.5	Windows Cryptographic Provider	26
4.5.1	Configuration	26
4.5.2	Selecting a certificate for signing	28

9.2.4	-af1 Signature font name 1	57
9.2.5	-af2 Signature font name 2	57
9.2.6	-afs1 Signature font size 1	58
9.2.7	-afs2 Signature font size 2	58
9.2.8	-al Signature line width	58
9.2.9	-ap Signature page number	58
9.2.10	-ar Signature annotation rectangle	58
9.2.11	-at1 Signature text 1	59
9.2.12	-at2 Signature text 2	59
9.2.13	-atc1 Signature text color 1	59
9.2.14	-atc2 Signature text color 2	59
9.2.15	-afn Signature form field name	59
9.2.16	-cci Signer contact info	60
9.2.17	-cfp Certificate fingerprint	60
9.2.18	-ci Certificate issuer	60
9.2.19	-cn Certificate name (Subject)	60
9.2.20	-cno Certificate serial number	61
9.2.21	-co Do not embed revocation information	61
9.2.22	-cp Cryptographic provider	61
9.2.23	-cpf Cryptographic session property (file)	62
9.2.24	-cps Cryptographic session property (string)	62
9.2.25	-cr Signature reason	62
9.2.26	-cs1 Certificate store location	63
9.2.27	-csn Certificate store name	63
9.2.28	-dap Document access permissions for DocMDP signature	63
9.2.29	-dss Add signature validation information to the document's DSS	64
9.2.30	-dts Create a timestamp signature	64
9.2.31	-fs Force signature	64
9.2.32	-mdp Create a DocMDP signature	64
9.2.33	-nc Disable cache for CRL and OCSP	65
9.2.34	-nd Disable the use of DSS when signing documents	65
9.2.35	-p2f Replace placeholder image with signature field	65

9.2.36	-rs Remove signatures	65
9.2.37	-vs Verify signature	66
9.2.38	-spc Create signature preview	66
9.2.39	-sps Sign signature preview	66
9.2.40	-st Set signature subfilter	66
9.2.41	-tsc Timestamp credentials	66
9.2.42	-tsu Timestamp URL	67
9.2.43	-wpc Web proxy server credentials	67
9.2.44	-wpu Web proxy server URL	67
9.3	Object hasher	67
9.3.1	-h Calculate object hashes	67
9.3.2	-vh Verify object hashes	68
9.4	General switches	68
9.4.1	-id Set value in the document information dictionary	68
9.4.2	-ax Add XMP metadata	68
9.4.3	-lk Set license key	68
9.4.4	-ow Optimize for the web	69
9.4.5	-owa Optimize for the Web automatically	69
9.4.6	-s Add stamps	70
9.4.7	-rls Remove legacy stamps	70
9.4.8	-v Verbose mode	70
9.5	Frequent error source	70
9.6	Tracing	71
9.7	Return codes	71
10	Stamping	72
10.1	Stamp file syntax	72
10.1.1	Stamp	73
	Coordinates	75
	Modify content of existing stamps	75
10.1.2	Stamp content	75
	Text	75
	Variable text	78
	Images and geometric shapes	79
	Transformations	80
10.2	Examples	81
10.2.1	Example 1: Simple stamps	81
10.2.2	Example 2: Modify “Simple Stamp”	81
10.2.3	Example 3: Add watermark text diagonally across pages	82
10.2.4	Example 4: Apply stamp to long edge of all pages	83
10.2.5	Example 5: Stamp links	84
11	Version history	85
11.1	Changes in versions 6.19–6.27	85
11.2	Changes in versions 6.13–6.18	85
11.3	Changes in versions 6.1–6.12	85
11.4	Changes in version 5	85
11.5	Changes in version 4.12	86
11.6	Changes in version 4.11	86
11.7	Changes in version 4.10	86
11.8	Changes in version 4.9	87
11.9	Changes in version 4.8	87

12 **Licensing, copyright, and contact** 88

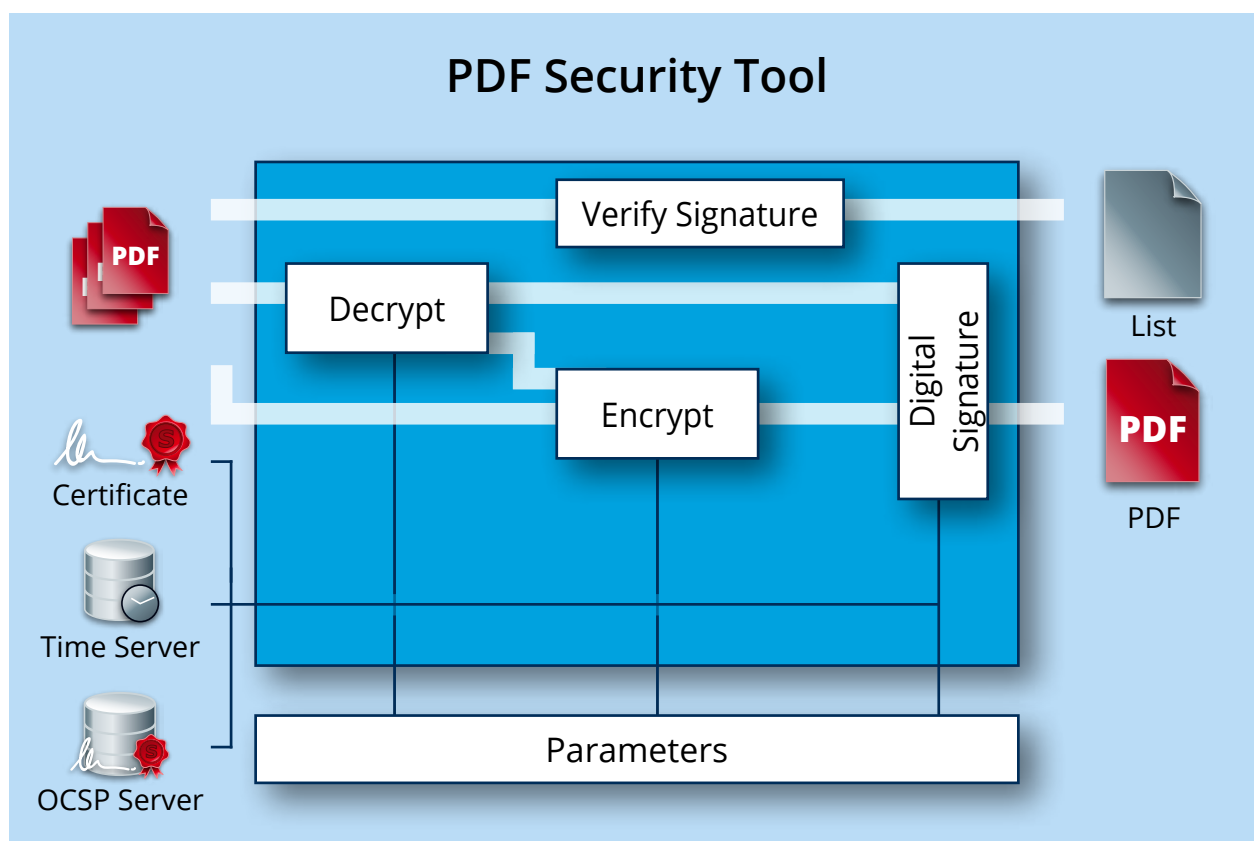

1 Introduction

1.1 Description

The 3-Heights® PDF Security Shell enables the application of digital signatures to PDF documents and their subsequent protection through setting passwords and user authorizations.

Both standard signatures and qualified signatures that use signature cards ("smartcards", "USB tokens", "HSM") can be used.

PDF documents used in professional circumstances contain important information that needs to be protected against misuse and unintentional alteration. This is achieved by protecting PDF documents through encryption and user authorization rights.

When exchanging electronic documents, the ability to ascertain that a document is authentic and has not been manipulated on its way from sender to recipient is of particular importance. This is only achievable through the use of electronic signatures.

1.2 Functions

The 3-Heights® PDF Security Shell enables users to encrypt and—if the passwords are known—decrypt PDF documents. The tool can set and cancel all known PDF user authorizations. For instance, it can set an owner password so that only authorized users can edit and change the document. A user password ensures that only authorized users have access to the document's content. The tool's signature module allows the user to apply, read, and verify both classic digital signatures and MDP (modification detection and prevention) signatures. The visibility and visual appearance of digital signatures can be adapted to suit requirements. The tool also supports customized signature handlers and types.

1.2.1 Features

- Apply simple, advanced, and qualified electronic signatures
 - PDF/A conforming signatures
 - Support European signature standards
 - Signature types
 - Document signatures to “digitally sign” documents
 - Modification detection & prevention (MDP) signatures to “certify” documents
 - Document timestamp signatures to “timestamp” documents
 - Apply PAdES-B-LTA (long-term availability and integrity of validation material) and PAdES-LTV (Long-Term Validation) signatures
 - Embedded trust chain, timestamp, and revocation information (OCSP, CRL)
 - Extend the longevity of existing signatures
 - Add signature validation material to the document security store (DSS)
 - Add an optional visual appearance of the signature (page, size, color, position, text, background image, etc.)
 - Cache OCSP, CRL, and other data for mass-signing
 - Various types of cryptographic providers
 - Windows certificate store
 - Hardware such as hardware security module (HSM), smartcards, and USB tokens
 - Online signature services
 - myBica Digital Signing Service
 - Swisscom All-in Signing Service
 - GlobalSign Digital Signing Service
 - QuoVadis sealsign
 - Multiple signatures
- Validate digital signatures
- Remove digital signatures
- Encrypt and decrypt PDF documents
 - Set document restrictions, including:
 - Print document
 - Modify document content
 - Extract or copy content
 - Add comments
 - Fill in form fields
 - Extract content for accessibility
 - Assemble documents
 - Print in high resolution
 - Set crypt and stream filters
 - Set encryption strength
 - Set owner and user password
- Stamping
 - Stamp text, images, or vector graphics
 - Add hyperlinks
 - Add PDF/A conforming stamps
 - Modify existing stamps
 - Stamping of signed documents preserves existing signatures
 - Stamp on layer
- Calculate hash of object sets to detect changes to a document
- Set document metadata
- Optimize for the web (linearize) (not for PDF 2.0)

1.2.2 Formats

Input formats

- PDF 1.x (PDF 1.0, ..., PDF 1.7)
- PDF 2.0
- PDF/A-1, PDF/A-2, PDF/A-3
- FDF

Output formats

- PDF 1.x (PDF 1.0, ..., PDF 1.7)
- PDF 2.0
- PDF/A-1, PDF/A-2, PDF/A-3

1.2.3 Conformance

Standards:

- ISO 32000-1 (PDF 1.7)
- ISO 32000-2 (PDF 2.0)
- ISO 19005-1 (PDF/A-1)
- ISO 19005-2 (PDF/A-2)
- ISO 19005-3 (PDF/A-3)
- PAdES (ETSI EN 319 142) signature levels B-B, B-T, B-LT, B-LTA, CMS
- Legacy PAdES baseline signature (ETSI TS 103 172) B-Level, T-Level, LT-Level, and LTA-Level
- Legacy PAdES (ETSI TS 102 778) Part 2 (PAdES Basic), Part 3 (PAdES-BES), and Part 4 (PAdES-LTV, Long-Term Validation)
- Long-term signature profiles for PAdES (ISO 14533-3)
- Cryptographic Suites (ETSI TS 119 312)

1.3 Operating systems

The 3-Heights® PDF Security Shell is available for the following operating systems:

- Windows Client 7+ | x86 and x64
- Windows Server 2008, 2008 R2, 2012, 2012 R2, 2016, 2019, 2022 | x86 and x64
- Linux:
 - Red Hat, CentOS, Oracle Linux 7+ | x64
 - Fedora 29+ | x64
 - Debian 8+ | x64
 - Other: Linux kernel 2.6+, GCC toolset 4.8+ | x64
- macOS 10.10+ | x64

'+' indicates the minimum supported version.

1.4 Digital signatures

1.4.1 Overview

Digital signature is a large and slightly complex topic. This chapter gives an introduction to digital signatures and describes how the 3-Heights® PDF Security Shell is used to apply them. It does however not describe all the technical details.

1.4.2 Terminology

Digital signature is a cryptographic technique of calculating a number (a digital signature) for a message. Creating a digital signature requires a private key from a certificate. Validating a digital signature and its authorship requires a public key. Digital Signature is a technical term.

Electronic signature is a set of electronic data that is merged or linked to other electronic data in order to authenticate it. Electronic Signatures can be created by means of a digital signature or other techniques. Electronic Signature is a legal term.

Abbreviations

CA	Certification Authority
CMS	Cryptographic Message Syntax
CRL	Certificate Revocation List
CSP	Cryptographic Service Provider
HSM	Hardware Security Module
OCSP	Online Certificate Status Protocol
PKCS	Public Key Cryptography Standards
QES	Qualified electronic signature
TSA	Timestamp Authority
TSP	Timestamp Protocol

1.4.3 Why digitally signing?

The idea of applying a digital signature in PDF is very similar to a handwritten signature: A person reads a document and signs it with its name. In addition to the name, the signature can contain further optional information, such as the date and location. A valid electronic signature is a section of data that can be used to:

- Ensure the integrity of the document
- Authenticate the signer of the document
- Prove existence of file prior to date (timestamp)

Digitally signing a document requires a certificate and its private key. How to access and use a certificate is described in [Cryptographic provider](#).

In a PDF document, a digital signature consists of two parts:

A PDF related part This part consists of the PDF objects required to embed the signature into the PDF document. This part depends on the signature type (document signature, MDP signature - see explanation). Information such as name of the signer, reason, date, and location is stored here. The signature may optionally have a visual appearance on a page of the PDF document, which can contain text, graphics, and images.

This part of the signature is entirely created by the 3-Heights® PDF Security Shell.

A cryptographic part A digital signature is based on a cryptographic checksum (hash value) calculated from the content of the document that is being signed. If the document is modified at a later time, the computed hash value is no longer correct and the signature becomes invalid, i.e. the validation fails and reports that the document has been modified since the signature was applied. Only the owner of the certificate and its private key is able to sign the document. However, anybody can verify the signature with the public key contained in the certificate.

This part of the signature requires a cryptographic provider for some cryptographic data and algorithms.

The 3-Heights® PDF Security Shell supports the following types of digital signatures:

Document signature A document signature type digital signature checks the integrity of the signed part of the document and authenticates the signer's identity. One or more document signatures can be applied. A signed document can be modified and saved by incremental updates. The state of the document can be re-created as it existed at the time of signing.

MDP signature A modification detection and prevention signature detects disallowed changes specified by the author. A document can contain only one MDP signature, which must be the first in the document. Other types of signatures may be present.

Document timestamp signature A timestamp signature provides evidence that the document existed at a specific time and protects the document's integrity. One or more document timestamp signatures can be applied. A signed document can be modified and saved by incremental updates.

1.4.4 What is an electronic signature?

There are different types of electronic signatures, which normally are defined by national laws, and therefore are different for different countries. The type of electronic signatures required in a certain process is usually defined by national laws. Quite advanced in this manner are German-speaking countries where such laws and an established terminology exist. The English terminology is basically a translation from German.

Three types of electronic signatures are distinguished:

- Simple Electronic Signature - "Einfache Elektronische Signatur"
- Advanced electronic signature (AdES) - "Fortgeschrittene Elektronische Signatur"
- Qualified electronic signature (QES) - "Qualifizierte Elektronische Signatur"

All applied digital signatures conform to PDF/A and PAdES.

Simple electronic signature

A simple electronic signature requires any certificate that can be used for digital signing. The easiest way to retrieve a certificate, which meets that requirement, is to create a self-signed certificate. Self-signed means it is signed by its owner. Therefore, the issuer of the certificate and the approver of the legitimacy of a document signed by this certificate is the same person.

Example:

Anyone can create a self-signed certificate issued by "Peter Pan" and issued to "Peter Pan". Using this certificate, a person can sign in the name of "Peter Pan".

If a PDF document is signed with a simple electronic signature and the document is changed after the signature had been applied, the signature becomes invalid. However, the person who applied the changes could, at the same time (maliciously), also remove the existing simple electronic signature and—after the changes—apply a new, equally looking Simple Electronic Signature and falsify its date. A simple electronic signature is neither strong enough to ensure the integrity of the document nor to authenticate the signer.

This drawback can overcome using an advanced or qualified electronic signature.

Advanced electronic signature

Requirements for advanced certificates and signatures vary depending on the country where they are issued and used.

An advanced electronic signature is based on an advanced certificate that is issued by a recognized certificate authority (CA) for the country, such as VeriSign, SwissSign, QuoVadis. To receive an advanced certificate, its owner must prove its identity, e.g. by physically visiting the CA and presenting its passport. The owner can be an individual or legal person or entity.

An advanced certificate contains the name of the owner, the name of the CA, its period of validity, and other information.

The private key of the certificate is protected by a PIN, which is only known to its owner.

This brings the following advantages over a simple electronic signature:

- The signature authenticates the signer.
- The signature ensures the integrity of the signed content.

Qualified electronic signature

Requirements for qualified certificates and signatures vary depending on the country where they are issued and used.

A qualified electronic signature is similar to an advanced electronic signature, but has higher requirements. The main differences are:

- It is based on a qualified certificate, which is provided as a hardware token (USB stick, smart card).
- For every signature, it is required to enter the PIN code manually. This means that only one signature can be applied at a time.
- Certificate revocation information (OCSP/CRL) can be acquired from an online service. The response (valid, revoked, etc.) must be embedded in the signature.
- A timestamp (TSP) that is acquired from a trusted time server (TSA) may be required.

This brings the following advantages over an advanced electronic signature:

- The signature ensures the certificate was valid at the time when the document was signed (due to the embedding of the OCSP/CRL response).
- The signature ensures the integrity of the time of signing (due to the embedding of the timestamp).
- Legal processes that require a QES are supported.

Note: A timestamp can be added to any type of signature. OCSP/CRL responses are also available for some advanced certificates.

1.4.5 Creating electronic signatures

This is a simple example of how to create an electronic document signature. More detailed examples and examples for other types of electronic signatures can be found in [Creating digital signatures](#).

Preparation steps

1. Identify whether an [Advanced electronic signature](#) or a [Qualified electronic signature](#) is required. For most automated processes, an advanced signature is sufficient.
2. Identify regulatory requirements regarding the content and life-cycle of the signature:
 - Is a timestamp required to prove that the signature itself existed at a certain date and time?
 - Should validation information be embedded to allow the signature to be validated long time after its generation?
 - Should the integrity of the validation material be protected?
 - Is a specific signature encoding required?

These requirements (or regulatory requirements) define the signature level that must be used.

3. Acquire a corresponding certificate from a CA.
For automated processes, it is recommended you use a HSM, an online signing service, or soft certificates. Other hardware such as USB tokens or smart cards are often cheaper, but limited to local interactive single-user applications.
When using an online signing service, ensure that it supports the required signature encoding.
4. Set up and configure the certificate's [Cryptographic provider](#).
 - In case the certificate resides on hardware such as an USB token or a smart card, the required middleware (driver) needs to be installed.
 - In case the certificate is a soft certificate, it must be imported into the certificate store of a cryptographic provider.
5. Optional: Acquire access to a trusted time server (TSA) (preferably from the CA of your signing certificate).
6. Optional: Ensure your input documents conform to the PDF/A standard.
It is recommended to sign PDF/A documents only, because this ensures that the file's visual appearance is well defined, as it can be reproduced flawlessly and authentically in any environment. Furthermore, PDF/A conformance is typically required if the file is to be archived. Because signed files cannot be converted to PDF/A without breaking its signatures, files must be converted before signing.

Note: A detailed guidance on the use of standards for signature creation can be found in the technical report ETSI TR 119 100.

Application of the signature

Apply the signature by providing the following information:

1. The [Cryptographic provider](#) where the certificate is located
2. Values for the selection of the signing certificate (e.g. the name of the certificate)
3. Optional: Timestamp service URL (e.g. "http://server.mydomain.com:80/tsa")
4. Optional: Timestamp service credentials (e.g. username:password)
5. Optional: Add validation information
6. Optional: Visual appearance of the signature on a page of the document (e.g. an image).

Example: Steps to add an electronic document signature

The 3-Heights® PDF Security Shell applies PDF/A conforming signatures. This means if a PDF/A document is digitally signed, it retains PDF/A conformance.

To add an electronic document signature with the 3-Heights® PDF Security Shell, the following steps need to be done:

1. Provide the certificate name (Subject).
2. Apply settings for the signature, such as the reason text, or the visual appearance (color, position, etc).
3. Process the PDF document by a user which has access to the selected certificate, and thereby, add the signature.

The certificate name is provided with the switch `-cn`, the reason with the switch `-cr`, and the provider (including the PIN to access the certificate's private key) with the switch `-cp`. A sample command looks like this:

```
pdfsecure  
-cn "Philip Renggli"  
-cp "c:\vp11.dll;0;secret-pin"  
-cr "I reviewed the document"  
-tsu "http://server.mydomain.com:80/tsa"  
-ar 10 10 200 50  
input.pdf output.pdf
```

The visual appearance of the digital signature on a page of the resulting output document looks as shown below:

2 Installation

2.1 Windows

The 3-Heights® PDF Security Shell comes as a ZIP archive or as an MSI installer.

To install the software, proceed as follows:

1. You need administrator rights to install this software.
2. Log in to your download account at <https://www.pdf-tools.com>. Select the product “PDF Security Shell”. If you have no active downloads available or cannot log in, please contact pdfsales@pdf-tools.com for assistance.

You can find different versions of the product available. Download the version that is selected by default. You can select a different version.

There is an MSI (*.msi) package and a ZIP (*.zip) archive available. The MSI (Microsoft Installer) package provides an installation routine that installs and uninstalls the product for you. The ZIP archive allows you to select and install everything manually.

There is a 32 and a 64-bit version of the product available. While the 32-bit version runs on both 32 and 64-bit platforms, the 64-bit version runs on 64-bit platforms only. The MSI installs the 64-bit version, whereas the ZIP archive contains both the 32-bit and the 64-bit version of the product. Therefore, on 32-bit systems, the ZIP archive must be used.

3. If you select an MSI package, start it and follow the steps in the installation routine.
4. If you are using the ZIP archive, unzip the archive to a local folder, e.g. C:\Program Files\PDF Tools AG\.

This creates the following subdirectories:

Subdirectory	Description
bin	Runtime executable binaries
doc	Documentation

5. (Optional) To easily use the 3-Heights® PDF Security Shell from a shell, the directory needs to be included in the “Path” environment variable.
6. (Optional) Register your license key using the [License management](#).
7. Ensure the cache directory exists as described in [Special directories](#).
8. If you want to sign documents, set up your cryptographic provider as described in [Cryptographic provider](#).
9. If you want to stamp text, set up the fonts required as described in [Fonts](#).

2.1.1 How to set the environment variable “Path”

To set the environment variable “Path” in Windows, go to Start → Control Panel (classic view) → System → Advanced → Environment Variables.

Select “Path” and “Edit”, then add the directory where pdfsecure.exe is located to the “Path” variable. If the environment variable “Path” does not exist, create it.

2.2 Linux and macOS

This section describes installation steps required on Linux or macOS.

Here is an overview of the files that come with the 3-Heights® PDF Security Shell:

File description

Name	Description
bin/x64/pdfsecure	Main executable
doc/*.*	Documentation

2.2.1 Linux

1. Unpack the archive in an installation directory, e.g. `/opt/pdf-tools.com/`
2. Verify that the GNU shared libraries required by the product are available on your system:

```
ldd pdfsecure
```

If the previous step reports any missing libraries, you have two options:

- a. Download an archive that is linked to a different version of the GNU shared libraries and verify whether they are available on your system. Use any version whose requirements are met. Note that this option is not available for all platforms.
 - b. Use your system's package manager to install the missing libraries. It usually suffices to install the package `libc++6`.
3. Create a link to the executable from one of the standard executable directories, e.g.

```
ln -s /opt/pdf-tools.com/bin/x64/pdfsecure /usr/bin
```

4. Optionally, register your license key using the [license manager](#).
5. Ensure the cache directory exists as described in [Special directories](#).
6. If you want to sign documents, set up your cryptographic provider as described in [Cryptographic provider](#).
7. If you want to stamp text, set up the fonts required as described in [Fonts](#).

2.3 Uninstall

If you have used the MSI for the installation, go to Start → 3-Heights® PDF Security Shell... → Uninstall ...

If you have used the ZIP file for the installation, undo all the steps done during installation.

2.4 Note about the evaluation license

With the evaluation license, the 3-Heights® PDF Security Shell automatically adds a watermark to the output files.

2.5 Special directories

2.5.1 Directory for temporary files

This directory for temporary files is used for data specific to one instance of a program. The data is not shared between different invocations and is deleted after termination of the program.

The directory is determined as follows. The product checks for the existence of environment variables in the following order and uses the first path found:

Windows

1. The path specified by the %TMP% environment variable
2. The path specified by the %TEMP% environment variable
3. The path specified by the %USERPROFILE% environment variable
4. The Windows directory

Linux and macOS

1. The path specified by the \$PDFTMPDIR environment variable
2. The path specified by the \$TMP environment variable
3. The /tmp directory

2.5.2 Cache directory

The cache directory is used for data that is persistent and shared between different invocations of a program. The actual caches are created in subdirectories. The content of this directory can safely be deleted to clean all caches.

This directory should be writable by the application; otherwise, caches cannot be created or updated and performance degrades significantly.

Windows

- If the user has a profile:
%LOCAL_APPDATA%\PDF Tools AG\Caches

- If the user has no profile:
 <TempDirectory>\PDF Tools AG\Caches

Linux and macOS

- If the user has a home directory:
 ~/.pdf-tools/Caches
- If the user has no home directory:
 <TempDirectory>/pdf-tools/Caches

where <TempDirectory> refers to the [Directory for temporary files](#).

2.5.3 Font directories

The location of the font directories depends on the operating system. Font directories are traversed recursively in the order as specified below.

If two fonts with the same name are found, the latter one takes precedence, i.e. user fonts always take precedence over system fonts.

Windows

1. %SystemRoot%\Fonts
2. User fonts listed in the registry key \HKEY_CURRENT_USER\Software\Microsoft\Windows NT\CurrentVersion\Fonts. This includes user specific fonts from C:\Users\<user>\AppData\Local\Microsoft\Windows\Fonts and app specific fonts from C:\Program Files\WindowsApps
3. Fonts directory, which must be a direct subdirectory of where pdfsecure.exe resides.

macOS

1. /System/Library/Fonts
2. /Library/Fonts

Linux

1. /usr/share/fonts
2. /usr/local/share/fonts
3. ~/.fonts
4. \$PDFFONTDIR or /usr/lib/X11/fonts/Type1

3 License management

The 3-Heights® PDF Security Shell requires a valid license in order to run correctly. If no license key is set or the license is not valid, then the executable will fail and the return code is set to 10.

More information about license management is available in the [license key technote](#).

3.1 License features

The functionality of the 3-Heights® PDF Security Shell contains two areas to which the following license features are assigned:

Signature Create, validate, and enhance signatures.

Stamping Apply and modify stamps.

A license can include an arbitrary set of these features. The presence of any feature in a given license key can be checked in the [license manager](#). The [Interface reference](#) specifies in more detail which functions are included in which license features.

4 Getting started

4.1 Basics

4.1.1 Usage

The usage of the 3-Heights® PDF Security Shell is:

```
pdfsecure [options] input.pdf output.pdf
```

A simple command to encrypt a document requires three parameters: The name of the PDF input file, the PDF output file, and the owner password.

Example: Read the input document "input.pdf", create a new document "output.pdf", set the owner-password of "output.pdf" to "ownerpassword" and the permissions to "allow print" and "allow filling of form fields".

```
pdfsecure -o ownerpassword -p pf input.pdf output.pdf
```

To list all available features, type "pdfsecure" without any parameters.

4.2 Specify the folder of the output file

The output folder can simply be added in front of the output file name.

```
pdfsecure input.pdf myfolder\output.pdf
```

or absolute (Windows):

```
pdfsecure input.pdf C:\myfolder\output.pdf
```

4.3 Encryption

4.3.1 Encryption and how it works in PDF

A PDF document can be encrypted to protect its contents from unauthorized access. The encryption process applies encryption to all streams (e.g. images) and strings, but not to other items in the PDF document. This means the structure of the PDF document is accessible, but the content of its pages is encrypted.

When encryption is used in PDF, a security handler must be selected. The 3-Heights® PDF Security Shell always uses the standard security handler that, according to the PDF Specification, has to be supported by any software that can process encrypted PDF documents.

For more detailed information about PDF encryption in general, see PDF Reference, chapter 3.5.

4.3.2 Owner password and user password

The standard security handler allows access permissions and up to two passwords to be specified for a document: An owner password and a user password.

user password protects the document against unauthorized opening and reading. If a PDF document is protected by a user password, either the user or owner password must be provided to open and read the document. If a document has a user password, it must have an owner password as well. If no owner password is defined, the owner password is the same as the user password.

owner password is also referred to as the author's password. This password grants full access to the document. Not only can the document be opened and read, it also allows for changing the document's security settings (access permission and passwords).

The following table shows the four possible combinations of passwords and how an application processing such a PDF document behaves.

Owner and user passwords

UserPwd	OwnerPwd	Behavior
none	none	Everyone can read. Everyone can change security settings. (No encryption)
none	set	Everyone can read. The user password is an empty string. Owner password required to change security settings.
set	none	User password required to read. The owner password is equal to the user password. User password required to change security settings.
set	set	User or owner password required to read. Owner password required to change security settings.

4.3.3 Permission flags

The operations in a PDF document that are granted are controlled via permission flags. To set permission flags, the PDF document must be encrypted and have an owner password. The owner password is required to initially set or later change the permission flags.

These access permission flags are:

- Modifying the content of the document
- Copying or extracting text and graphics from the document
- Adding or modifying text annotations and interactive form fields
- Printing the document (low or high quality)
- Filling in forms and digitally signing the document
- Assembling the document (inserting, rotating, deleting pages, etc.)

4.3.4 Encrypting a PDF document

If either of the passwords or permission flags is set, the document is encrypted.

If only a user password is set, but no owner password and no permission flags, the owner password is equal to the user password and all permissions are granted.

Example: Create a document where only low resolution printing is allowed

```
pdfsecure -o ownerpassword -p pinput.pdf output.pdf
```

Example: Create a document where only low resolution printing is allowed and the user is prompted for a password upon opening the document. The user must therefore know either the user or the owner password.

```
pdfsecure -o ownerpassword -u userpassword -p p input.pdf output.pdf
```

Example: To create a non-encrypted document, do not set any of the switches `-o`, `-u`, `-p`.

```
pdfsecure input.pdf output.pdf
```

4.3.5 Reading an encrypted PDF document

A PDF document that is not encrypted or protected with an owner password only can be read and decrypted by the 3-Heights® PDF Security Shell without providing a password.

A PDF document that is protected by a user password can only be opened if either the user or the owner password is provided using the `-pw` option. Technically, it does not matter later on which of the two passwords was provided, because both grant full access to the document. However, it is up to the application programmer to distinguish between input documents that are password protected or not.

4.3.6 How secure is PDF encryption?

Any PDF application that is to process or display a PDF document must be able to read and decrypt the contents of the pages to be able to display them. Technically, it cannot display an encrypted text or image without first decrypting it. A PDF application program has therefore full access to any PDF document it can decrypt and display.

PDF application programs such as all products of the PDF Security Shell family or Adobe Acrobat, can open and decrypt PDF documents that have an owner password but no user password, without knowing that password. Otherwise, they couldn't display the document. The application at that point has full access to the document. However, this does not imply the user of this application is given the same access rights. The user should only be given the access permissions defined by the permission flags and the password provided. Any PDF application that behaves different from that can allow for changing the security settings or completely removing encryption from the document as long as the original document does not have a user password.

The user password protects the document, so that it only can be opened if the user or owner password is known. No PDF application program can open a user-password protected PDF document without providing the password. The security of such a document, however, strongly depends on the password itself. Like in most password-related situations, insecure passwords can easily be found programmatically. For example, a brute force attempt testing all passwords that either exist as word in a dictionary or have less than six characters only takes minutes.

4.3.7 Setting permission flags for Acrobat

In Acrobat 7, there are four different fields/check boxes that can be set. The corresponding setting is shown in brackets using the parameter `-p`.

1. Printing allowed
 - None ("")
 - Low resolution (p)
 - High resolution (pd)
2. Changes allowed:
 - None ("")
 - Inserting, deleting and rotating pages (a)

- Filling in form fields and signing existing signature fields (f)
 - Commenting, filling in form fields, and signing existing signature fields (fo)
 - Any except extracting pages (fom)
3. Enable copying of text, images and other content (sc)
 4. Enable text access for screen reader devices for the visually impaired (s)

These flags can be combined.

Example: To grant permission that are equal to Acrobat's 7 "Printing Allowed: High Resolution" and "Enable copying of text, images and other content", set the flags `pdsc`.

```
pdfsecure -o ownerpassword -p pdsc input.pdf output.pdf
```

4.4 Cryptographic provider

In order to use the 3-Heights® PDF Security Shell's cryptographic functions such as creating digital signatures, a cryptographic provider is required. The cryptographic provider manages certificates and their private keys, and implements cryptographic algorithms.

The 3-Heights® PDF Security Shell can use various different cryptographic providers. The following list shows the provider that can be used for each type of signing certificate.

USB token or smart card These devices typically offer a PKCS#11 interface, which is the recommended way to use the certificate → [PKCS#11 provider](#).

On Windows, the certificate is usually also available in the [Windows Cryptographic Provider](#).

In any case, signing documents is only possible in an interactive user session.

Hardware Security Module (HSM) HSMs always offer very good PKCS#11 support → [PKCS#11 provider](#)

For more information and installation instructions, see the separate document [TechNotePKCS11.pdf](#).

Soft certificate Soft certificates are typically PKCS#12 files that have the extension `.pfx` or `.p12` and contain the signing certificate, as well as the private key and trust chain (issuer certificates). Soft certificate files cannot be used directly. Instead, they must be imported into the certificate store of a cryptographic provider.

- *All platforms:* The recommended way of using soft certificates is to import them into a store that offers a PKCS#11 interface and use the [PKCS#11 provider](#). For example:

- A HSM
- openCryptoki on Linux

For more information and installation instructions of the stores, see the separate document [TechNotePKCS11.pdf](#).

- *Windows:* If no PKCS#11 provider is available, soft certificates can be imported into Windows certificate store, which can then be used as cryptographic provider → [Windows Cryptographic Provider](#)

Signature service Signature services are a convenient alternative to storing certificates and key material locally. The 3-Heights® PDF Security Shell can use various different services. The configuration is explained in the following sections of this documentation:

- [myBica Digital Signing Service](#)
- [Swisscom All-in Signing Service](#)
- [GlobalSign Digital Signing Service](#)
- [QuoVadis sealsign](#)

4.4.1 PKCS#11 provider

PKCS#11 is a standard interface offered by most cryptographic devices such as HSMs, USB tokens, or sometimes even soft stores (e.g. openCryptoki).

More information on and installation instructions of the PKCS#11 provider of various cryptographic devices can be found in the separate document [TechNotePKCS11.pdf](#).

Configuration

Provider Option `-cp`

The provider configuration string has the following syntax:

"<PathToDll>;<SlotId>;<Pin>"

<PathToDll> Path to driver library filename, which is provided by the manufacturer of the HSM, UBS token, or smart card. Examples:

- The CardOS API from Atos (Siemens) uses `siicap11.dll`
- The IBM 4758 cryptographic coprocessor uses `cryptoki.dll`
- Devices from Aladdin Ltd., use `etpkcs11.dll`
- For SafeNet Luna, HSM use `cryptoki.dll` on Windows or `libCryptoki2_64.so` on Linux/UNIX.
- For Securosys SA, Primus HSM or CloudsHSM, use `primusP11.dll`¹ on Windows and `libprimusP11.so`¹ on Linux.
- For Google Cloud HSM (Cloud KMS), use `libkmsp11.so`².

<SlotId> (optional). If it is not defined, it is searched for the first slot that contains a running token.

<Pin> (optional). If it is not defined, the submission for the PIN is activated via the pad of the token.

If this is not supported by the token, the following error message is raised when signing: "Private key not available."

Example:

```
-cp "C:\Windows\system32\siicap11.dll;4;123456"
```

Interoperability support

The following cryptographic token interface (PKCS#11) products have been successfully tested:

- SafeNet Protect Server
- SafeNet Luna
- SafeNet Authentication Client
- IBM OpenCryptoki
- CryptoVision
- Siemens CardOS
- Utimaco SafeGuard CryptoServer
- Securosys SA CloudsHSM¹

¹ It is recommended to use version 1.7.32 or newer of the Primus HSM PKCS#11 Provider.

² Must be used as described in [PKCS#11 devices that contain private keys only](#).

Selecting a certificate for signing

The 3-Heights® PDF Security Shell offers different ways to select a certificate. The product tries the first of the following selection strategies, for which the required values have been specified by the user.

1. Certificate fingerprint

Option [-cfp](#)

- SHA-1 fingerprint of the certificate. The fingerprint is 20 bytes long and can be specified in hexadecimal string representation, e.g. "b5 e4 5c 98 5a 7e 05 ff f4 c6 a3 45 13 48 0b c6 9d e4 5d f5". In Windows certificate store, this is called "Thumbprint", if "Thumbprint algorithm" is "sha1".

2. Certificate issuer and serial number

Options [-ci](#) and [-cno](#)

- Certificate issuer (e.g. "QV Schweiz CA"). In Windows certificate store, this is called "Issued By".
- Serial number of the certificate (hexadecimal string representation, e.g. "4c 05 58 fb"). This is a unique number assigned to the certificate by its issuer. In Windows certificate store, this is the field called "Serial number" in the certificate's "Details" tab.

3. Certificate name and issuer (optional)

Options [-cn](#) and [-ci](#)

- Common Name of the certificate (e.g. "PDF Tools AG"). In Windows certificate store, this is called "Issued To".
- Optional: Certificate issuer (e.g. "QV Schweiz CA"). In Windows certificate store, this is called "Issued By".

Using PKCS#11 stores with missing issuer certificates

Some PKCS#11 devices contain the signing certificate only. However, to embed revocation information, it is important that the issuer certificates, i.e. the whole trust chain, is available as well.

On Windows, missing issuer certificates can be loaded from the Windows certificate store. Missing certificates can be installed as follows:

1. Get the certificates of the trust chain. You can download them from the website of your certificate provider or do the following:
 - a. Sign a document and open the output in Adobe Acrobat.
 - b. Go to "Signature Properties" and then view the signer's certificate.
 - c. Select a certificate of the trust chain.
 - d. Export the certificate as "Certificate File" (extension `.cer`).
 - e. Do this for all certificates of the trust chain.
2. Open the exported files by double clicking on them in Windows Explorer.
3. Click "Install Certificate...".
4. Select "automatically select the certificate store based on the type of certificate" and finish import.

PKCS#11 devices that contain private keys only

Some PKCS#11 devices, such as the Google Cloud HSM (Cloud KMS), can only store private keys and no certificates. In such cases, it is possible to supply the required certificates externally using the option [-cps](#).

Name	Type	Required	Value
------	------	----------	-------

Certificate	Bytes	Required	<p>The signing certificate in either PEM (.pem, ASCII text) or DER (.cer, binary) form.</p> <p>This certificate must be selected as the signing certificate as described in Selecting a certificate for signing.</p>
PrivateKeyUri	String	Required	<p>The RFC 7512 URI specifying the private key object in the store. The following URI formats are supported:</p> <p>pkcs11:object=<label> To specify the CKA_LABEL object attribute of the private key. The <label> is a text string that is converted to UTF-8 and percent-decoded before matching the CKA_LABEL attribute.</p> <p>Example: "pkcs11:object=Signing Certificate"</p> <p>pkcs11:id=<id> To specify the CKA_ID object attribute of the private key. The value of the <id> can be percent-encoded to match CKA_ID attributes with binary data.</p> <p>Example: "pkcs11:id=%C8%48%EC%66%00%17%01%BA%AE%06"</p> <p>This private key object must belong to the certificate that was specified by the session property Certificate.</p>
TrustChain	Bytes	Recommended	<p>The certificates of the trust chain in either PEM (.pem, ASCII text) or DER (.cer, binary) form. Multiple certificates can be concatenated into a single byte stream.</p> <p>Supplying the certificates is highly recommended and required, if revocation information (CRL, OCSP) should be embedded (see Option -co).</p>

```
pdfsecure -v -cp "myPKCS11.dll;0;pin" -cn "Signing Certificate" ^
-cpf Certificate signing-certificate.cer ^
-cps PrivateKeyUri "pkcs11:object=Signing Certificate" ^
-cpf TrustChain trust-chain.cer ^
input.pdf signed.pdf
```

4.4.2 Cryptographic suites

Message digest algorithm

The default hash algorithm to create the message digest is **SHA-256**. Other algorithms can be chosen by setting the provider session property **MessageDigestAlgorithm**, for which supported values are:

SHA-1 This algorithm is considered broken and therefore strongly discouraged by the cryptographic community.

SHA-256 (default)

SHA-384

SHA-512

RIPEMD-160

Signing algorithm

The signing algorithm can be configured by setting the provider session property [SigAlgo](#). Supported values are:

RSA_RSA (default) This is the RSA PKCS#1v1.5 algorithm, which is widely supported by cryptographic providers.

RSA_SSA_PSS This algorithm is sometimes also called RSA-PSS.

Signing will fail if the algorithm is not supported by the cryptographic hardware. The device must support either the signing algorithm CKM_RSA_PKCS_PSS (i.e. RSA_SSA_PSS) or CKM_RSA_X_509 (i.e. raw RSA).

Note: Setting the signing algorithm only has an effect on signatures created by the cryptographic provider itself. All signed data acquired from external sources may use other signing algorithms, specifically the issuer signatures of the trust chain, the timestamp's signature, or those used for the revocation information (CRL, OCSP). It is recommended to verify that the algorithms of all signatures provide a similar level of security.

4.5 Windows Cryptographic Provider

This provider uses Windows infrastructure to access certificates and to supply cryptographic algorithms. Microsoft Windows offers two different APIs, the Microsoft CryptoAPI and Cryptography API Next Generation (CNG).

Microsoft CryptoAPI Provides functionality for using cryptographic algorithms and for accessing certificates stored in the Windows certificate store and other devices, such as USB tokens, with Windows integration.

Microsoft CryptoAPI does not support some new cryptographic algorithms, such as SHA-256.

Cryptography API: Next Generation (CNG) CNG is an update to CryptoAPI. It extends the variety of available cryptographic algorithms, e.g. by the SHA-256 hashing algorithms. If possible, the 3-Heights® PDF Security Shell performs cryptographic calculations with CNG instead of CryptoAPI.

CNG is available only if:

- The operating system is at least Windows Vista or Windows Server 2008.
- The provider of the signing certificate's private key, e.g. the USB token or smart card, supports CNG.

If CNG is not available, the CryptoAPI's cryptographic algorithms are used. In any case, CryptoAPI is used for the certificate accessing functionalities.

Default message digest algorithm: Since version 4.6.12.0 of the 3-Heights® PDF Security Shell, the default message digest algorithm is SHA-256. As a result, signing will fail if CNG is not available (error message "Private key not available."). To use SHA-1, the provider session property [MessageDigestAlgorithm](#) can be used. Use of SHA-1 is strongly discouraged by the cryptographic community.

4.5.1 Configuration

Provider Option [-cp](#)

The provider configuration string has the following syntax:

```
"[<ProviderType>:]<Provider>[;<PIN>]"
```

The <ProviderType> and <PIN> are optional. The corresponding drivers must be installed on Windows. If CNG is available, <ProviderType> and <Provider> are obsolete and can be omitted.

Optionally, when using an advanced certificate, the PIN code (password) can be passed as an additional, semi-column separated parameter <PIN>. This does not work with qualified certificates, because they always require the PIN code to be entered manually every time.

If <Provider> is omitted, the default provider is used. The default provider is suitable for all systems where CNG is available.

Examples: Use the default provider with no PIN.

```
Provider = ""
```

Examples: "123456" being the PIN code.

```
Provider = ";123456"
```

```
Provider = "Microsoft Base Cryptographic Provider v1.0;123456"
```

```
Provider = "PROV_RSA_AES:Microsoft Enhanced RSA and AES Cryptographic" _  
+ "Provider;123456"
```

Certificate store Option [-csn](#)

The value for the certificate store depends on the OS. Supported values are: "CA", "MY" and "ROOT". For signature creation, the default store "MY" is usually the right choice.

Store location Option [-csl](#)

Either of the following store locations:

- "Local machine"
- "Current user" (default)

Usually, personal certificates are stored in the "current user" location and company-wide certificates are stored under "local machine".

The "current user" store is only available, if the user profile has been loaded. This may not be the case in certain environments, such as within an IIS web application or COM+ applications. Use the store of the local machine if the user profile cannot be loaded. For other services, it is sufficient to log on as the user. Some cryptographic hardware (such as smart cards or USB tokens) require an interactive environment. As a result, the private key might not be available in the service session, unless the 3-Heights® PDF Security Shell is run interactively.

Certificates in the "Local Machine" store are available to all users. However, in order to sign a document, you need access to the signing certificate's private key. The private key is protected by Windows ACLs and typically readable for Administrators only. Use the Microsoft Management Console (`mmc.exe`) to grant access to the private key for other users as follows:

Add the Certificates Snap-in for the certificates on local machine. Right-click on the signing certificate, click on "All Tasks" and then "Manage Private Keys..." where you can set the permissions.

4.5.2 Selecting a certificate for signing

Within the certificate store selected by [Store location](#) and [Certificate store](#), the selection of the signing certificate works the same as with the PKCS#11 provider. For more information, see [Selecting a certificate for signing](#).

4.5.3 Certificates

To sign a PDF document, a valid existing certificate name must be provided and its private key must be available.

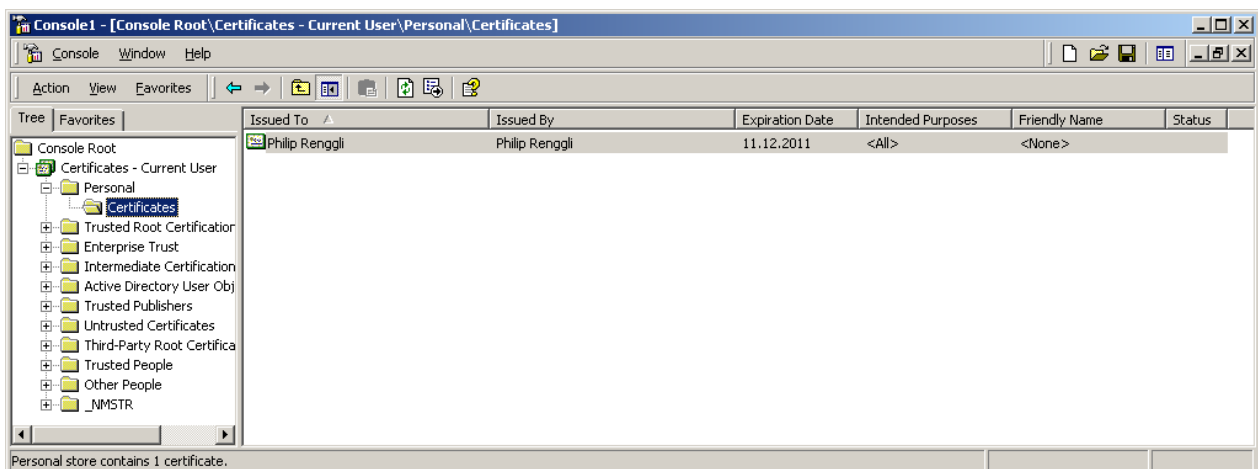

There are various ways to create or obtain a certificate. How this is done is not described in this document. This document describes the requirements for and how to use the certificate.

On the Windows operating system, certificates can be listed by the Microsoft Management Console (MMC), which is provided by Windows. To see the certificates available on the system, perform the following steps:

1. To launch the MMC, go to Start → Run... → type “mmc”, or start a Command Prompt and type “mmc”.

2. Under “File” → “Add/Remove Snap-in”.
3. Choose “Certificates” and click the “Add” button.
4. In the next window choose to manage certificates for “My user account”.
5. Click “Finish”.
6. The certificate must be listed under the root “Certificates - Current User”. For example, as shown in the screenshot below:

7. Double-click the certificate to open. The certificate name corresponds to the value “Issued to”.

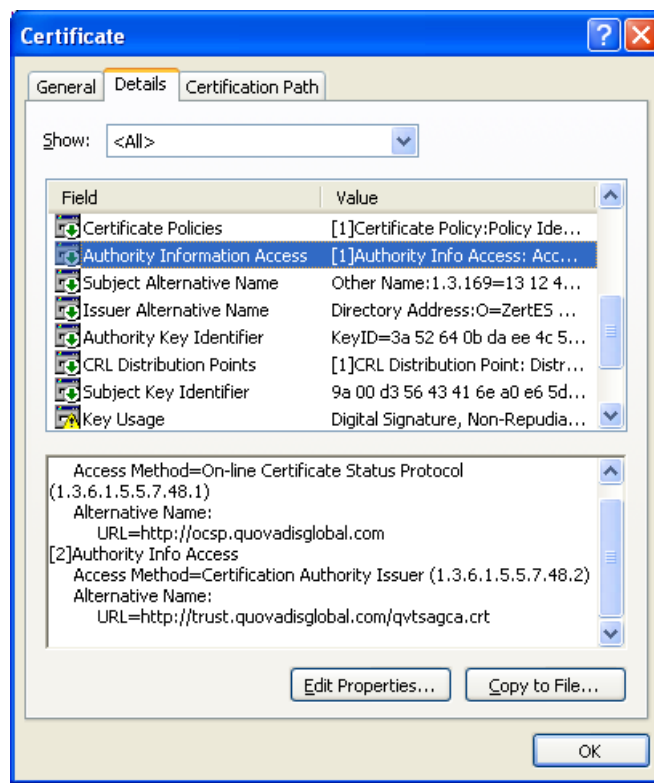

8. In the Details tab of the certificate, there is a field named “Key Usage”. This field must contain the value “Digital Signature”. Additional values are optional. See the figure below.
You must have the private key that corresponds to this certificate.

4.5.4 Qualified certificates

A qualified certificate can be obtained from a certificate authority (CA). Besides the requirements listed in the previous chapter, it has the additional requirement to contain the key “Authority Information Access”, which contains the information about the OCSP server.

4.5.5 Cryptographic suites

The message digest algorithm and the signing algorithm can be chosen as described for the PKCS#11 provider in [Cryptographic suites](#).

The `MessageDigestAlgorithm` can only be set to a value other than `SHA-1` if the private key's provider supports CNG.

The `SigAlgo` can only be set to `RSA_SSA_PSS` if the private key's provider supports CNG.

4.6 myBica Digital Signing Service

Provider Option `-cp`

The provider configuration string contains the URL to the service endpoint, typically, `https://sign.my-bica.ch/DS/DS`.

Provider configuration The provider can be configured using provider session properties.

There are two types of properties:

- “String” Properties:
String properties are set using option `-cps`.
- “File” Properties:
File properties are set using option `-cpf`.

Name	Type	Required	Value
Identity	String	Required	The identity of your signing certificate. Example: My Company:Signing Cert 1
DSSProfile	String	Required	Must be set to http://www.pdf-tools.com/dss/profile/pades/1.0
SSLClientCertificate	File	Required	SSL client certificate in PKCS#12 Format (.p12, .pfx). File must contain the certificate itself, all certificates of the trust chain and the private key.
SSLClientCertificatePassword	String	Optional	Password to decrypt the private key of the SSL client certificate.
SSLServerCertificate	File	Recommended	Certificate of the server or its issuer (CA) certificate (.crt). The certificate may be in either PEM (ASCII text) or DER (binary) form. Note: If this property is not set, the server certificate's trustworthiness cannot be determined. As a result, the connection is not guaranteed to be secure.
RequestID	String	Recommended	Any string that can be used to track the request. Example: An UUID like AE57F021-C0EB-4AE0-8E5E-67FB93E5BC7F

Signature configuration The signature can be customized using standard options of the 3-Heights® PDF Security Shell.

Description	Required	Value	Setting
Common Name	Required	The name of the signer must be set ³ .	Option -cn .
Timestamp	optional	Use the value urn:ietf:rfc:3161 to embed a timestamp.	Option -tsu
Signature Format	Optional	To set the signature format	Option -st . Must be adbe.pkcs7.detached
Revocation Info	Recommended	To embed OCSP responses or CRL.	Option -co ⁴

Visual Appearance

Optional

See [Creating a visual appearance of a signature](#).

Proxy configuration If a proxy is used for the connection to the service, see [Using a proxy](#) for more information.

4.7 QuoVadis sealsign

Provider Option [-cp](#)

The provider configuration string contains the URL to the QuoVadis sealsign service.

- Demo service:
<https://services.sealsignportal.com/sealsign/ws/BrokerClient>
- Productive service:
<https://qvchsvsws.quovadisglobal.com/sealsign/ws/BrokerClient>

Provider configuration The provider can be configured using provider session properties that can be set using the options [-cps](#) or [-cpf](#).

Name	Type	Required	Value
Identity	String	Required	The account ID is the unique name of the account specified on the server. Example: Rigora
Profile	String	Required	The profile identifies the signature specifications by a unique name. Example: Default
secret	String	Required	The secret is the password which secures the access to the account. Example: NeE=EKEd33FeCk70
clientId	String	Required	A client ID can be used to help separating access and creating better statistics. If specified in the account configuration it is necessary to provide this value. Example: 3949-4929-3179-2818
pin	String	Required	The PIN code is required to activate the signing key. Example: 123456

³ This parameter is not used for certificate selection, but for the signature appearance and description in the PDF only.

⁴ The recommendation is to not use the option [-co](#).

MessageDigestAlgorithm	String	Optional	The message digest algorithm to use. Default: SHA-256 Alternatives: SHA-1 , SHA-384 , SHA-512 , RIPEMD-160 , RIPEMD-256
-------------------------------	--------	----------	---

Signature configuration The signature can be customized using standard options.

Description	Required	Value	Setting
Common Name	Required	The name of the signer must be set ⁵ .	Option -cn .
Timestamp	-	Not available.	
Revocation Info	Recommended	To embed OCSP responses or CRL.	Option -co ⁶
Visual Appearance	Optional	See Creating a visual appearance of a signature .	

Proxy configuration If a proxy is used for the connection to the service, see [Using a proxy](#) for more information.

4.8 Swisscom All-in Signing Service

4.8.1 General properties

To use the signature service, the following general properties have to be set:

Description	Required	Value	Setting
Common Name	Required	Name of the signer ⁷ .	Option -cn
Provider	Required	The service endpoint URL of the REST service. Example: https://ais.swisscom.com/AIS-Server/rs/v1.0/sign	Option -cp
Timestamp	optional	Use the value urn:ietf:rfc:3161 to embed a timestamp.	Option -tsu
Signature Format	Optional	To set the signature format	Option -st . Supported values are adbe.pkcs7.detached , ETSI.CAdES.detached , ETSI.RFC3161 ⁸ .

⁵ This parameter is not used for certificate selection, but for the signature appearance and description in the PDF only.

⁶ The recommendation is to not use the option **-co**.

Revocation Info	Optional	To embed OCSP responses	Option <code>-co</code> . Supported with <code>adbe.pkcs7.detached</code> only.
------------------------	----------	-------------------------	---

If a proxy is used for the connection to the service, see [Using a proxy](#) for more information.

4.8.2 Provider session properties

In addition to the general properties, a few provider specific session properties have to be set.

There are two types of properties:

- "String" Properties:
String properties are set using option `-cps`.
- "File" Properties:
File properties are set using option `-cpf`.

Name	Type	Required	Value
DSSProfile	String	Required	Must be set to <code>http://ais.swisscom.ch/1.0</code>
SSLClientCertificate	File	Required	SSL client certificate in PKCS#12 Format (.p12, .pfx). File must contain the certificate itself, all certificates of the trust chain and the private key.
SSLClientCertificatePassword	String	Optional	Password to decrypt the private key of the SSL client certificate.
SSLServerCertificate	File	Recommended	Certificate of the server or its issuer (CA) certificate (.crt). The certificate may be in either PEM (ASCII text) or DER (binary) form. Note: If this property is not set, the server certificate's trustworthiness cannot be determined. As a result, the connection is not guaranteed to be secure.
Identity	String	Required	The Claimed Identity string as provided by Swisscom: <code><customer name>:<key identity></code>
RequestID	String	Recommended	Any string that can be used to track the request. Example: An UUID like <code>AE57F021-C0EB-4AE0-8E5E-67FB93E5BC7F</code>

⁷ This parameter is not used for certificate selection, but for the signature appearance and description in the PDF only.

⁸ `ETSI.RFC3161` is automatically set when signing with `-dts`

4.8.3 On-demand certificates

To request an on-demand certificate, the following additional property has to be set:

Name	Type	Required	Value
SwisscomAllInOnDemandDN	String	Required	The requested distinguished name. Example: cn=Hans Muster,o=ACME,c=CH

4.8.4 Step-up authorization using Mobile-ID

To use the step-up authorization, the following additional properties have to be set:

Name	Type	Required	Value
SwisscomAllInMSISDN	String	Required	Mobile phone number. Example: +41798765432
SwisscomAllInMessage	String	Required	The message to be displayed on the mobile phone. Example: Pipapo halolu.
SwisscomAllInLanguage	String	Required	The language of the message. Example: DE

Those properties have to comply with the Swisscom Mobile-ID specification.

4.9 GlobalSign Digital Signing Service

Provider Option [-cp](#)

The provider configuration string contains the URL to the service endpoint.

<https://emea.api.dss.globalsign.com:8443/v2>

Provider configuration The provider can be configured using provider session properties.

There are two types of properties:

- “String” Properties:
String properties are set using option [-cps](#).
- “File” Properties:
File properties are set using option [-cpf](#).

Name	Type	Required	Value
api_key	String	Required	Your account credentials’ key parameter for the login request.

api_secret	String	Required	Your account credentials' secret parameter for the login request.
Identity	String	Required	<p>Parameter to create the signing certificate.</p> <p>Example for an account with a static identity: <code>{ }</code></p> <p>Example for an account with a dynamic identity: <code>{ "subject_dn": { "common_name": "John Doe" } }</code></p>
SSLClientCertificate	File	Required	<p>SSL client certificate in PKCS#12 Format (.p12, .pfx).</p> <p>File must contain the certificate itself, all certificates of the trust chain and the private key.</p>
SSLClientCertificatePassword	String	Optional	Password to decrypt the private key of the SSL client certificate.
SSLServerCertificate	File	Recommended	<p>Certificate of the server or its issuer (CA) certificate (.crt). The certificate may be in either PEM (ASCII text) or DER (binary) form.</p> <p>Note: If this property is not set, the server certificate's trustworthiness cannot be determined. As a result, the connection is not guaranteed to be secure.</p>

Signature configuration The signature can be customized using standard options of the 3-Heights® PDF Security Shell.

Description	Required	Value	Setting
Common Name	Required	The name of the signer must be set ⁹ .	Option -cn .
Timestamp	recommended	Use the value <code>urn:ietf:rfc:3161</code> to embed a timestamp.	Option -tsu
Signature Format	Optional	To set the signature format	Option -st . Supported values are <code>adbe.pkcs7.detached</code> , <code>ETSI.CAdES.detached</code> , <code>ETSI.RFC3161</code> ⁸ .
Revocation Info	Recommended	To embed OCSP responses or CRL.	Option -co ¹⁰

Visual Appearance

Optional

See [Creating a visual appearance of a signature](#).

Proxy configuration If a proxy is used for the connection to the service, see [Using a proxy](#) for more information.

Creating the SSL client certificate

When creating a new account, GlobalSign will issue an SSL client certificate `clientcert.crt`. The following command creates a PKCS#12 file `certificate.p12` that can be used for the [SSLClientCertificate](#):

```
openssl pkcs12 -export -out certificate.p12 -inkey privateKey.key -in clientcert.crt
```

Getting the SSL server certificate

The SSL server certificate can either be found in the technical documentation of the “Digital Signing Service” or downloaded from the server itself:

1. Get the server’s SSL certificate:

```
openssl s_client -showcerts -connect emea.api.dss.globalsign.com:8443 ^  
-cert clientcert.crt -key privateKey.key
```

2. The certificate is the text starting with “-----BEGIN CERTIFICATE-----” and ending with “-----END CERTIFICATE-----”. Use the text to create a text file and save it as `server.crt`.
3. Use `server.crt` or one of its CA certificates for the [SSLServerCertificate](#).

Advice on using the service

There are rate limits for both creating new identities and for signing operations. If multiple documents must be signed at once, use the API version of the 3-Heights® PDF Security Shell, which can re-use the same session (and hence its signing certificates) for signing.

Due to the short-lived nature of the signing certificates, it is important to embed revocation information immediately. For example, by using [-dss](#) or not [-co](#). Furthermore, it is highly recommended to embed a timestamp to prove that the signature was created during the certificate’s validity period.

4.10 External signature handler

The 3-Heights® PDF Security Shell provides the capability of using an external signature handler. The external signature handler has full control over the creation of the cryptographic part of a signature. This makes it possible to implement proprietary signing algorithms.

The process is as follows:

1. A new preview-PDF document is created using the option [-spc](#). This document does not contain a digital signature; however, it contains a placeholder for it.

⁹ This parameter is not used for certificate selection, but for the signature appearance and description in the PDF only.

¹⁰ The recommendation is to not use the option [-co](#).

The expected size of the cryptographic signature and the signature's **SubFilter** must be specified using the option **-ss**

```
pdfsecure -spc -ss "adbe.pkcs7.detached" 4600 -cn "..." input.pdf preview.pdf  
byte range: 0,639,9841,2464
```

The 3-Heights® PDF Security Shell prints the byte range to standard output. The byte range is a comma-separated array of pairs of integers (starting byte offset, length in bytes) that describes the exact byte range for the digest calculation.

2. The external signature handler calculates a hash of the preview-PDF over the byte range. A digital signature is created thereof and written to a file `signature.bin`.
3. The signature is written into the preview-PDF using the option **-sps** and **-sf**.

```
pdfsecure -sps -sf signature.bin preview.pdf signed.pdf
```

4.10.1 -ss Set signature size

```
Set signature size -ss <subfilter> <n>
```

Parameters:

<subfilter> The signature's **SubFilter**, i.e. the signing algorithm. For example, "adbe.pkcs7.detached" or "ETSI.CAdES.detached".

<n> The expected size of the signature in bytes. This should be an upper bound. The signature inserted afterwards with the option **-sf** must not be larger than **<n>** bytes.

4.10.2 -sf Add cryptographic signature from file

```
Add cryptographic signature from file -sf <file>
```

Parameter:

<file> The file containing the cryptographic signature.

%

5 Creating digital signatures

This chapter describes the steps that are required to create different types of digital signatures. A good introductory example can be found in [Creating electronic signatures](#).

5.1 Creating a preview of a signed document

The 3-Heights® PDF Security Shell lets you create a PDF document with a visual appearance of a digital signature without actually signing the document. This document can be used for a preview. If the preview is accepted, the document can be signed without visually changing the document. The process steps to prepare a document for signing and actually sign it upon approval of the user are as shown in the graphic below:

1. A new preview PDF document is created using the option `-spc`. This document does not contain a digital signature; however, it contains a placeholder for a signature and optionally, a visual appearance. The cryptographic provider and all options for signature selection and configuration must be specified. This is required to calculate the size of the signature placeholder.

```
pdfsecure -v -cp "..." -cn "..." ... -spc input.pdf preview.pdf
```

2. If the preview PDF is approved, the document is signed using the option `-sps`.

```
pdfsecure -v -cp "..." -cn "..." ... -sps preview.pdf signed.pdf
```

It is crucial that all options required for signature selection and configuration are identical as in the command above.

5.2 Creating a PAdES signature

The PAdES European standard (ETSI EN 319 142) recommends that one of the following four baseline signature levels be used:

PAdES-B-B A digital signature.

PAdES-B-T A digital signature with a timestamp token.

PAdES-B-LT A digital signature with a timestamp token and signature validation data. The signature is a long-term signature or “LTV enabled”.

PAdES-B-LTA A digital signature with a timestamp token and signature validation data protected by a document timestamp.

The lifecycle of digital signatures and the usage of these signature levels are described in more detail in chapter 8.11.6 “Digital signatures lifecycle” of ETSI TR 119 100.

Note: The Decision 2015/1506/EU of the eIDAS Regulation (Regulation (EU) N°910/2014) still refers to the previous legacy PAdES baseline signature standard ETSI TS 103 172. However, the signatures as created by the 3-Heights® PDF Security Shell are compatible.

The [Compatibility of PAdES signature levels](#) shows how the signature levels described above and as created by the 3-Heights® PDF Security Shell conform with other standards.

Compatibility of PAdES signature levels

ETSI EN 319 142	ETSI TS 102 778	ETSI TS 103 172	ISO 14533-3
PAdES-B-B	PAdES-BES (Part 3)	PAdES B-Level	-
PAdES-B-T	PAdES-BES (Part 3)	PAdES T-Level	PAdES-T
PAdES-B-LT	PAdES-BES (Part 3)	PAdES LT-Level	PAdES-A
PAdES-B-LTA	PAdES-LTV (Part 4)	PAdES LTA-Level	PAdES-A

Requirements

For general requirements and preparation steps, see [Creating electronic signatures](#).

Requirements

Level	Signing Certificate	Timestamp	Product
PAdES-B-B	any	no	3-Heights® PDF Security Shell
PAdES-B-T	any	required	3-Heights® PDF Security Shell
PAdES-B-LT	advanced or qualified certificate	required	3-Heights® PDF Security Shell
PAdES-B-LTA	advanced or qualified certificate	required	3-Heights® PDF Security Shell

Make sure the trust store of your cryptographic provider contains all certificates of the trust chain, including the root certificate. Also include the trust chain of the timestamp signature, if your TSA server does not include them in the timestamp.

A proper error handling is crucial in order to ensure the creation of correctly signed documents. The output document was signed successfully, if and only if the 3-Heights® PDF Security Shell returns code 0 (success).

Note on encryption and linearization: Because signature levels PAdES-B-LT and PAdES-B-LTA must be created in a two-step process, the files cannot be linearized and encryption parameters cannot be changed. When creating signature levels PAdES-B-B or PAdES-B-T that may later be augmented, linearization should not be used and all encryption parameters (user password, owner password, permission flags, and encryption algorithm) must be the same for both steps.

PAdES vs. CAdES: CAdES is an ETSI standard for the format of digital signatures. The format used in PAdES is based on CAdES, which is why the format is called **ETSI.CAdES.detached** (see [-st](#)). Because PAdES defines additional requirements suitable for PDF signatures, mere CAdES conformance is not sufficient.

5.2.1 Create a PAdES-B-B signature

Input document Any PDF document.

Cryptographic provider A cryptographic provider that supports the creation of PAdES signatures.

```
pdfsecure -cp "myPKCS11.dll;0;pin" -cn "..." -st "ETSI.CAdES.detached" -co ^  
input.pdf pad-es-b-b.pdf
```

5.2.2 Create a PAdES-B-T signature

Input document Any PDF document.

Cryptographic provider A cryptographic provider that supports the creation of PAdES signatures.

```
pdfsecure -cp "myPKCS11.dll;0;pin" -cn "..." -st "ETSI.CAdES.detached" -co ^  
-tsu "http://server.mydomain.com/tsa" input.pdf pad-es-b-t.pdf
```

5.2.3 Create a PAdES-B-LT signature

Input document A PDF document with a PAdES-B-T signature created using an advanced or qualified certificate.

Cryptographic provider Any cryptographic provider.

```
pdfsecure -cp "myPKCS11.dll;0;pin" -dss pad-es-b-t.pdf pad-es-b-lt.pdf
```

5.2.4 Create a PAdES-B-LTA signature or extend longevity of a signature

Input document

- A PDF document with a PAdES-B-T signature created using an advanced or qualified certificate, or
- a PAdES-B-LTA signature whose longevity should be extended.

Cryptographic provider Any cryptographic provider whose trust store contains all certificates required for [-dss](#).

```
pdfsecure -cp "myPKCS11.dll;0;pin" -dss -dts -tsu "http://server.mydomain.com/tsa" ^  
pad-es-b-t.pdf pad-es-b-lta.pdf
```

5.3 Applying multiple signatures

Multiple signatures can be applied to a PDF document. One signature must be applied at the time. Signing a signed file does not break existing signatures, because the 3-Heights® PDF Security Shell uses an incremental update.

Signing a linearized file renders the linearization information unusable. Therefore, it is recommended to not linearize files that need to be signed multiple times.

```
pdfsecure -cn "First Signer" input.pdf tmp.pdf
pdfsecure -cn "Second Signer" tmp.pdf output.pdf
```

5.4 Creating a timestamp signature

For a timestamp signature, no local signing certificate is required. Instead the timestamp signature requested from the timestamp authority (TSA) is embedded into the document. Nonetheless, a [Cryptographic provider](#) that supports timestamp signatures is required.

Example: Create a timestamp signature using the option [-dts](#).

```
pdfsecure ^
-cp "myPKCS11.dll" ^
-tsu "http://server.mydomain.com/tsa" ^
-dts ^
input.pdf output.pdf
```

5.5 Creating a visual appearance of a signature

Each signature may have a visual appearance on a page of the document. The visual appearance is optional and has no effect on the validity of the signature. Because of this and because a visual appearance may cover important content of the page, the 3-Heights® PDF Security Shell creates invisible signatures by default.

To create a visual appearance, a non-empty signature rectangle must be set. For example, by setting the option `-ar 10 10 200 50` the following appearance is created:

Different properties of the visual appearance can be specified.

Page and position See options [-ap](#) and [-ar](#).

Color See options [-acf](#) and [-acs](#).

Line width The line width of the background rectangle, see option [-a1](#).

Text Two text fragments can be set using two different fonts, font sizes, and colors see options [-at1](#), [-at2](#), [-atc1](#), [-atc2](#), [-af1](#), [-af2](#), [-afs1](#), and [-afs2](#).

Background image See options [-abg](#).

5.6 Miscellaneous

5.6.1 Caching of CRLs, OCSP, and timestamp responses

To improve the speed when mass signing, the 3-Heights® PDF Security Shell provides a caching algorithm to store CRL (Certificate Revocation List), OCSP (Online Certificate Status Protocol), TSP (Timestamp Protocol) and data from signature services. This data is usually valid over period of time that is defined by the protocol, which is normally at least 24 hours. Caching improves the speed, because there are situations when the server does not need to be contacted for every digital signature.

The following caches are stored automatically by the 3-Heights® PDF Security Shell at the indicated locations within the [Cache directory](#):

Certificates	<CacheDirectory>/Certificates/hash.cer
CRL	<CacheDirectory>/CLRs/server.der
OCSP responses	<CacheDirectory>/OCSP Responses/server-hash.der
Service data	<CacheDirectory>/Signature Sizes/hash.bin
Timestamp responses ¹¹	<CacheDirectory>/Time Stamps/server.der

The caches can be cleared by deleting the files. Usage of the caches can be deactivated by setting the option [-nc](#). The files are automatically updated if the current date and time exceeds the “next update” field in the OCSP or CRL response, respectively, or the cached data was downloaded more than 24 hours ago.

5.6.2 Using a proxy

The 3-Heights® PDF Security Shell can use a proxy server for all communication to remote servers, e.g. to download CRL or for communication to a signature service. The proxy server can be configured using the provider session property [Proxy](#). The property's value must be a string with the following syntax:

```
http[s]://[<user>[:<password>]@<host>[:<port>]]
```

Where:

- [http](#) / [https](#): Protocol for connection to proxy.
- [<user> : <password>](#) (optional): Credentials for connection to proxy (basic authorization).
- [<host>](#): Hostname of proxy.
- [<port>](#): Port for connection to proxy.

For SSL connections, e.g. to a signature service, the proxy must allow the HTTP CONNECT request to the signature service.

Example: Configuration of a proxy server that is called “myproxy” and accepts HTTP connections on port 8080.

```
-cps "Proxy" "http://myproxy:8080"
```

¹¹ The sizes of the timestamp responses are cached only. Cached timestamp responses cannot be embedded but used for the computation of the signature length only.

5.6.3 Configuring a proxy server and firewall

For the application of a timestamp or online verification of certificates, the signature software requires access to the server of the certificates' issuer (e.g. <http://ocsp.quovadisglobal.com> or <http://platinum-qualified-g2.ocsp.swisssign.net/>) via HTTP. The URL for verification is stored in the certificate; the URL for timestamp services is provided by the issuer. If these functions are not configured, no access is required.

In organizations where a web proxy is used, it must be ensured that the required MIME types are supported. These are:

OCSP

- `application/ocsp-request`
- `application/ocsp-response`

Timestamp

- `application/timestamp-query`
- `application/timestamp-reply`

Signature services

- Signature service-specific MIME types.

5.6.4 Setting the signature build properties

In the signature build properties dictionary, the name of the application that created the signature can be set using the provider session properties `Prop_Build.App.Name` and `Prop_Build.App.REx`. The default values are "3-Heights® PDF Security Shell" and its version.

6 Validating digital signatures

6.1 Validating a qualified electronic signature

There are basically three items that need to be validated:

1. Trust chain
2. Revocation information (optional)
3. Timestamp (optional)

Validation can be done in different ways, e.g. Adobe Acrobat, from which the screenshots below are taken.

6.1.1 Trust chain

Before the trust chain can be validated, ensure the root certificate is trusted. There are different ways to add a certificate as trusted root certificate. The best way on Windows is this:

1. Retrieve a copy of the certificate containing a public key. This can be done by requesting it from the issuer (your CA) or by exporting it from an existing signature to a file (`CertExchange.cer`). Ensure you are not installing a malicious certificate!
2. Add the certificate to the trusted root certificates. If you have the certificate available as file, you can simply double-click it to install it.

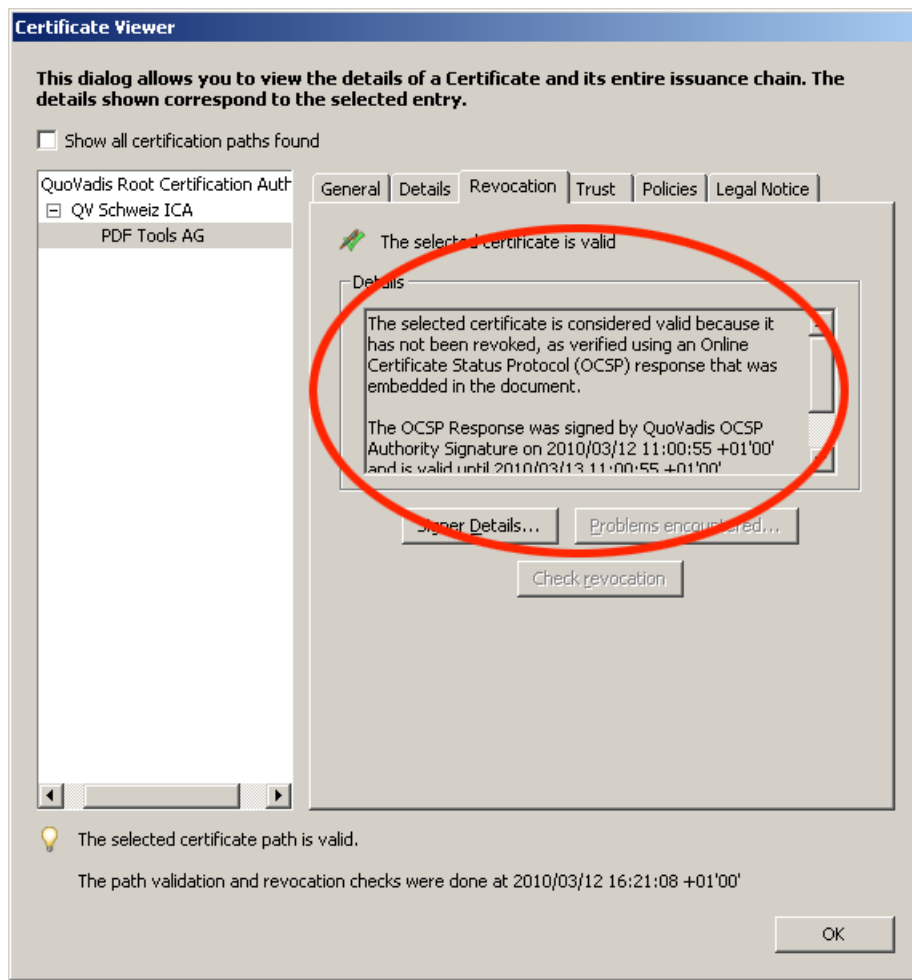

After that you can validate the signature, e.g. by opening the PDF document in Adobe Acrobat, right-click the signature and select "Validate", then select "Properties", and select the tab "Trust". There the certificate should be trusted to "sign documents or data".

6.1.2 Revocation information

An OCSP response or CRL must be available. This is shown in the tab “Revocation”. The details should mention that “the certificate is considered *valid*”.

The presence of revocation information must be checked for the signing certificate and all certificates of its trust chain, except for the root certificate.

6.1.3 Timestamp

The signature can optionally contain a timestamp. This is shown in the tab "Date/Time". The certificate of the time-stamp server must also be trusted, i.e. its trust chain should be validated as described in the section Trust Chain above.

6.2 Validating a PAdES LTV signature

Verifying if a signature conforms to the PAdES LTV standard is similar to validating a Qualified Electronic Signature.

The following must be checked:

1. Trust chain
2. Revocation information
3. Timestamp
4. LTV expiration date
5. Other PAdES requirements

6.2.1 Trust chain

Trust chain validation works the same as for validating Qualified Electronic Signatures.

6.2.2 Revocation information

Revocation information (OCPS response or CRL) must be valid and embedded into the signature. In the details, verify that the revocation check was performed using data that was *“was embedded in the signature or embedded in the document”*. Revocation information that *“was contained in the local cache”* or *“was requested online”* is not embedded into the signature and does not meet PAdES LTV requirements. If Adobe Acrobat claims that revocation

information is contained in the local cache, even though it is embedded into the document, restart Adobe Acrobat and validate the signature again.

6.2.3 Timestamp

A timestamp must be embedded and validated as described for validating Qualified Electronic Signatures. If a document contains multiple timestamps, all but the latest one must contain revocation information.

6.2.4 LTV expiration date

The long-term validation ability expires with the expiration of the signing certificate of the latest timestamp.

The lifetime of the protection can be further extended beyond the life of the last timestamp applied by adding further DSS information to validate the previous last timestamp as well as a new timestamp. This process is described in [Creating a PAdES signature](#).

6.2.5 Other PAdES requirements

Certain other PAdES requirements, such as requirements on the PKCS#7 CMS, cannot be validated using Adobe Acrobat. For this, use the 3-Heights® PDF Security API for validation.

7 Fonts

Some features of the 3-Heights® PDF Security Shell require fonts to be installed, e.g. for stamping text or the creation of the visual appearance of digital signatures.

Note that on Windows, when a font is installed, it is by default installed only for a particular user. It is important to either install fonts for all users, or make sure the 3-Heights® PDF Security Shell is run under that user and the user profile is loaded.

7.1 Font cache

A cache of all fonts in all [Font directories](#) is created. If fonts are added or removed from the font directories, the cache is updated automatically.

In order to achieve optimal performance, make sure that the cache directory is writable for the 3-Heights® PDF Security Shell. Otherwise, the font cache cannot be updated and the font directories have to be scanned on each program startup.

The font cache is created in the subdirectory <CacheDirectory>/Installed Fonts of the [Cache directory](#).

8 Object hasher

The object hashing feature calculates the hashes of different sets of objects, which allows to reliably detect changes to a document. The object hash is suitable for all applications where an external hash is required, e.g. for digital signature applications employing a [blockchain](#).

Prior to hashing, objects are normalized such that meaningless differences do not break the hash. For example, the file can be linearized without breaking the hash. This is the main difference to the document hash calculated for a [digital signature](#), which does not allow any modification to the document.

8.1 Object sets

For each object set, a separate hash is calculated. Two documents are equal if all of their hashes are equal. If certain changes to a document are allowed, the respective hashes can be ignored. For example, most applications may want to ignore “volatile metadata”. Other applications may allow form fields to be filled in, in which cases the hash for “form field values” can be ignored.

The object sets are disjoint and their members described in more detail below.

Pages and their content Modifications of pages and their content changes this hash. Modifications of pages includes adding and removing pages. Modification of content includes all modifications to the content stream and used resources.

Form field values Filling in form fields changes this hash.

Signature fields Signing or removing signatures changes this hash.

Interactive features Adding/removing/modifying annotations (e.g. notes, comments, form fields, or links), modifying embedded files, modifying actions changes this hash. This set does not include the values of form fields and signature annotations, which both belong to two other object sets.

Volatile metadata Modifying volatile metadata such as modify date or producer changes this hash. If a document is re-saved, e.g. when optimizing for fast web view (linearized), volatile metadata is updated by most PDF writers.

Metadata Modifying non-volatile metadata, e.g. PDF/A conformance, document title, or the creation date, changes this hash.

Encryption Modifying encryption parameters (permissions, encryption algorithm) changes this hash. Re-encrypting the document using the same parameter does not change this hash.

8.2 Calculating object hashes

The object hashes of an input file `input.pdf` can be calculated using the `-h` option as follows:

```
pdfsecure -h SHA-256 hash.xml input.pdf
```

8.3 Verifying hashes

The following steps are required to verify whether the objects of a file, e.g. `test.pdf`, match these hashed previously, e.g. in `hash.xml`.

1. Determine the version used

Parse the XML file `hash.xml` to determine which version of the 3-Heights® PDF Security Shell was used to create it. The version is indicated in the `version` attribute of the root XML element `<hashes>`.

```
...  
<hashes xmlns="http://www.pdf-tools.com/pdfhash/"  
  algorithm="SHA-256" version="4.8.22.0" file="test.pdf">  
...
```

2. Verify the hashes

Use the same version of the 3-Heights® PDF Security Shell to verify the hashes. There are two ways to do this. Either the option `-vh` can be used:

```
pdfsecure-4.8.22.0 -vh hash.xml test.pdf
```

Alternatively, a new hash file can be calculated and compared to the original `hash.xml`. Make sure to use the same hashing algorithm as indicated by the attribute `algorithm`:

```
pdfsecure-4.8.22.0 -h SHA-256 test-hash.xml test.pdf
```

8.3.1 Hash dependency on the product version

Currently, hashes are dependent on the product version. Before computing the object hashes, all objects are normalized. It is to be expected that in future versions of the 3-Heights® PDF Security Shell, these algorithms will be improved to make them even more tolerant of meaningless differences. For this reason, the hash is dependent on the version of the tool used.

The object hashing feature is available in the shell variant of the product only, because this is the only variant that allows to easily install multiple versions in parallel. Invoking a specific version of the shell tool is simple and it has been designed such that it is easy to use in an automated environment, e.g. by providing a meaningful return code and error messages to standard error.

9 Interface reference

Switches are options that are provided with the command to define how the document should be processed.

Switches can occur in two forms: as stand-alone option such as `-v` (verbose mode), or they may require a parameter such as `-pw password` (set password to read encrypted input document).

The last two parameters of the command line should always be the input and the output document.

Switches are parsed from left to right. If the same switch is applied multiple times, the last set value is applied.

9.1 Encryption

9.1.1 -fe Force encryption

Force encryption `-fe`

File encryption is not allowed by the PDF/A standard. Therefore, 3-Heights® PDF Security Shell aborts and returns an error when encryption is configured and an input file is PDF/A. Use this option to enable encryption of PDF/A conforming files. The conformance of the output file is downgraded to PDF.

9.1.2 -fm Set stream crypt filter

Set stream crypt filter `-fm <name>`

Set the stream crypt filter. Supported values for `<name>` are the following strings: None, V2, RC4, AESV2, and AESV3. Certain PDF viewers require the stream crypt filter to be equal to the string crypt filter, e.g. both must be RC4 or AES. Other tools such as the 3-Heights® PDF Tools do not have this limitation. Setting an empty string selects the default filter.

Example: Set the stream crypt filter and the string crypt file to AESV2

```
pdfsecure -o owner -fm AESV2 -fr AESV2 input.pdf output.pdf
```

9.1.3 -fr Set string crypt filter

Set string crypt filter `-fr <name>`

Set the string crypt filter. Supported values are the following strings: None, V2, RC4, AESV2, and AESV3. Setting an empty string selects the default filter.

Supported values for the crypt filter are described in the following table:

Description of supported values for setting the string crypt filter

Values	Description
None	The application does not decrypt data.
V2 or RC4	(PDF 1.2, default) The application asks the security handler for the encryption key and implicitly decrypts data using the RC4 algorithm.
AESV2	(PDF 1.6) The application asks the security handler for the encryption key and implicitly decrypts data with using the AES-V2 128 bit algorithm.
AESV3	(PDF 1.7) The application asks the security handler for the encryption key and implicitly decrypts data with using the AES-V3 256 bit algorithm.

9.1.4 -k Set the length of the encryption key

Set the length of the encryption key -k <key-length>

The key length is a determining factor of the strength of the encrypting algorithm and the amount of time to break the cryptographic system. For RC4, the key length can be any value from 40 to 128 that is a multiple of 8. For AESV2, the key length is automatically set to 128; for AESV3, to 256.

Notes:

- Certain PDF viewers only support 40 and 128 bit encryption. Other tools such as the 3-Heights® tools also support other encryption key lengths.
- 256 bit encryption requires Acrobat 9 or later.
- If the selected permission flags require a minimum key length, the key length is automatically adjusted (e.g. to 128 bits).

9.1.5 -o Owner password

Owner password -o <owner>

The owner password is required to change the security settings of the document. To apply permission flags, an owner password must be set. Permission flags are set with the [-p](#) switch.

Example: Encrypt a document and set the owner password to <owner>.

```
pdfsecure -o owner input.pdf output.pdf
```

9.1.6 -p Permission flags

Permission flags -p <flags>

This option sets the permission flags. It is only usable when producing encrypted documents. In other words, at least an owner password must be set with [-o](#), and additionally a user password can be set with [-u](#). When omitting the [-p](#) option, then all permissions are granted. The permissions that can be granted are listed below.

Permission flags

Flag	Description
p	Allow printing (low resolution)
m	Allow change of the document
c	Allow content copying or extraction
o	Allow commenting
f	Allow filling of form fields
s	Allow content extraction for accessibility
a	Allow document assembly
d	Allow high quality printing
i	Set the same permissions as in the input file
Ø	Allow nothing (no permissions are granted)

The actual `<flags>` given to this option is a string that contains one or several of the permission flags above.

Note: The `i` and `Ø` values cannot be combined with any other permission flags.

Example: The following command sets the owner password to “owner” and the permission flags to “allow printing in low resolution” and “allow form filling”.

```
pdfsecure -o owner -p pf input.pdf output.pdf
```

Example: “High quality printing” requires the standard printing flag to be set too.

```
pdfsecure -o owner -p pd input.pdf output.pdf
```

Example: Create a document with the same permission settings as present in the input document.

```
pdfsecure -o owner -p i input.pdf output.pdf
```

For further information about the permission flags, see [PDF Reference 1.7](#) Section 3.5.2.

9.1.7 -pw Read an encrypted PDF file

```
Read an encrypted PDF file -pw <password>
```

A PDF document that has a user password (the password to open the document) can only be processed when either the user or the owner password is provided. The password can be provided using the option `-pw` followed by the password.

Example: The input PDF document is encrypted with a user password. Either the user or the owner password of the input PDF is "mypassword". The command to process such an encrypted file is:

```
pdfsecure -pw mypassword input.pdf output.pdf
```

When a PDF is encrypted with a user password and the password is not provided or is incorrect, the 3-Heights® PDF Security Shell cannot read and process the file. Instead it generates the following error message:

```
Password wasn't correct.
```

9.1.8 -u User password

User password `-u <user>`

Set the user password of the document. If a document that has a user password is opened for any purpose (such as viewing, printing, editing), either the user or the owner password must be provided.

A user who knows the user password is able to open and read the document. A user who knows the owner password is able to open, read, and modify (e.g. change passwords) the document. A PDF document can have none, either, or both passwords.

Example: Encrypt a document with a user and an owner password

```
pdfsecure -u userpassword -o ownerpassword input.pdf output.pdf
```

9.2 Digital signatures

For more information on digital signatures in general, see section [Digital signatures](#). For more information on how to create digital signatures, see section [Creating digital signatures](#).

9.2.1 -abg Signature background image

Signature background image `-abg <image>`

This is the background image that is added to the signature. The image is centered and scaled down proportionally to fit into the given rectangle. If the path is **Nothing**, or the image does not exist, the appearance's background is a filled rectangle using the colors fill color and stroke color.

To create a signature with the image only, set the signature text 1 and 2 to a space " ".

9.2.2 -acf Signature fill color

Signature fill color `-acf <rgb>`

This is the color of the signature's background as in RGB value. The default is 16761024 (red = 192, green = 192, blue = 255). To not set a color, i.e. keep the rectangle transparent, set it to -1.

Color examples: Color values are
 $\text{color} = \langle \text{red} \rangle + \langle \text{green} \rangle \times 256 + \langle \text{blue} \rangle \times 256 \times 256$,
where $\langle \text{red} \rangle$, $\langle \text{green} \rangle$ and $\langle \text{blue} \rangle$ assume values from 0 to 255.

	Red	255, 0, 0	255
	Green	0, 255, 0	65 ' 280
	Blue	0, 0, 255	16 ' 711 ' 680
	Cyan	0, 255, 255	16 ' 776 ' 960
	Magenta	255, 0, 255	16 ' 711 ' 935
	Yellow	255, 255, 0	65 ' 535
	Black	0, 0, 0	0
	Gray	128, 128, 128	8 ' 421 ' 504
	White	255, 255, 255	16 ' 777 ' 215

9.2.3 -acs Signature stroke color

Signature stroke color -acs $\langle \text{rgb} \rangle$

This is the color of the signature's border line as RGB value. The default is 8405056 (red = 64, green = 64, blue = 128). To avoid setting a color, i.e. keep it transparent, set it to -1.

9.2.4 -af1 Signature font name 1

Signature font name 1 -af1 $\langle \text{font name} \rangle$

This defines the font used in upper text, i.e. the text that is set by the property [-at1](#). The font can either be specified as a path to the font file, e.g. "C:\Windows\Fonts\arial.ttf", or as a font name, such as "Times New Roman, Bold". When using a font name, the corresponding font must be present in one of the font directories described in [Fonts](#).

9.2.5 -af2 Signature font name 2

Signature font name 2 -af2 $\langle \text{font name} \rangle$

This is the font used in lower text, i.e. the text that is set by [-at2](#). The option works analogously to [-af1](#).

9.2.6 -afs1 Signature font size 1

Signature font size 1 -afs1

This defines the font size in points used in upper text, i.e. the text that is set by the property [-at1](#). If the font size is not specified, a default value of 16pt is used.

9.2.7 -afs2 Signature font size 2

Signature font size 2 -afs2

This is the font size in points used in lower text, i.e. the text that is set by [-at2](#). The option works analogously to [-afs1](#). If the font size is not specified, a default value of 8pt is used.

9.2.8 -al Signature line width

Signature line width -al <width>

This is the thickness of the line surrounding the visual signature in points.

9.2.9 -ap Signature page number

Signature page number -ap <page>

Set the page number of where the visual appearance of the digital signature should be placed. The numbers are counted starting from 1 for the first page. The default is the last page. The last page can also be set using -1 as argument.

9.2.10 -ar Signature annotation rectangle

Signature annotation rectangle -ar <x> <y> <w> <h>

Set the position and size of the digital signature annotation. The default is an invisible signature (-ar 0 0 0 0).

The position is defined by the four values for the lower-left corner (x, y) and dimensions (w, h) of the rectangle. The units are PDF points (1 point = 1/72 inch, A4 = 595 x 842 points, Letter = 612 x 792 points) measured from the lower left corner of the page. If either the width or height is zero or negative, an invisible signature is created, i.e. no visible appearance is created for the signature.

Example: Create a 200 by 60 points rectangle in the upper left corner of an A4 page.

```
pdfsecure -cn "... " -ar 10 770 200 60 input.pdf output.pdf
```

9.2.11 -at1 Signature text 1

Signature text 1 -at1 <text>

This is the upper text that is added to the signature.

If this property is not set, the signing certificate's name set with [-cn](#) is added to the upper text line of the visual signature.

See [Creating a visual appearance of a signature](#) for more information on customizing the appearance of digital signatures.

9.2.12 -at2 Signature text 2

Signature text 2 -at2 <text>

This is the lower text that is added to the signature. The text can be multi-lined by using carriage returns.

If this property is not set, a three-line text is constructed that consists of:

- A statement who applied to signature
- The reason of the signature. This can be set using [-cr](#).
- The date

See [Creating a visual appearance of a signature](#) for more information on customizing the appearance of digital signatures.

9.2.13 -atc1 Signature text color 1

Signature text color 1 -atc1 <rgb>

This option sets the color of the upper text, i.e. the text that is set by [-at1](#).

The default is black: 0 (red = 0, green = 0, blue = 0). See [-acf](#) for more examples of color values.

9.2.14 -atc2 Signature text color 2

Signature text color 2 -atc2 <rgb>

This option sets the color of the lower text, i.e. the text that is set by [-at2](#).

The default is black: 0 (red = 0, green = 0, blue = 0). See [-acf](#) for more examples of color values.

9.2.15 -afn Signature form field name

Signature form field name -afn <field name>

Specify the name of the signature form field. If the input document contains a signature field of this name, the existing field is signed. Otherwise, a new field of this name is created.

Example: Sign form field "Signature2"

```
pdfsecure -cp "myPKCS11.dll;0;pin" -cn "..." -afn Signature2 ^  
-tsu "http://server.mydomain.com/tsa" input.pdf output.pdf
```

Signing of existing fields is not supported for document timestamp and MDP signatures.

9.2.16 -cci Signer contact info

Signer contact info -cci <info>

Add a descriptive text as signer contact info, e.g. a phone number. This enables a recipient to contact the signer to verify the signature. This is not required in order to create a valid signature.

9.2.17 -cfp Certificate fingerprint

Certificate fingerprint -cfp <fp>
License feature: **Signature**

Set the hex string representation of the signer certificate's sha1 fingerprint. All characters outside the ranges 0-9, a-f and A-F are ignored. In the Microsoft Management Console, the "Thumbprint" value can be used without conversion, if the "Thumbprint algorithm" is "sha1". E.g. "b5 e4 5c 98 5a 7e 05 ff f4 c6 a3 45 13 48 0b c6 9d e4 5d f5". This property can be used to select the signer certificate for signing (see [Cryptographic provider](#)).

9.2.18 -ci Certificate issuer

Certificate issuer -ci <issuer>
License feature: **Signature**

The issuer of the certificate. The "Certificate Issuer" corresponds to the common name (CN) of the issuer. In the Windows certificate store, this corresponds to "Issued by". This property can be used to select the signer certificate for signing (see [Cryptographic provider](#)).

9.2.19 -cn Certificate name (Subject)

Certificate name (Subject) -cn <name>
License feature: **Signature**

Set the name of the certificate used to sign the document (see [Cryptographic provider](#)). The name corresponds to the common name (CN) of the subject. In the Windows certificate store, this corresponds to "Issued to".

See [Digital signatures](#) to learn more about digital signatures in general and how to sign documents with the 3-Heights® PDF Security Shell.

Example: Sign the document

```
pdfsecure -cn "Philip Renggli" input.pdf output.pdf
```

The signature is added on the last page of the signed document.

9.2.20 -cno Certificate serial number

Certificate serial number -cno <serialno>
License feature: **Signature**

Set the serial number of the certificate. Specify a hex string as displayed by the "Serial number" field in the Microsoft Management Console (MMC), e.g. "49 cf 7d d1 6c a9". This property can be used to select the signer certificate for signing (see [Cryptographic provider](#)).

9.2.21 -co Do not embed revocation information

Do not embed revocation information -co

This switch inhibits the embedding of revocation information such as online certificate status response (OCSP - RFC 2560) and certificate revocation lists (CRL - RFC 3280). Revocation information is either an OCSP response or a CRL, which is provided by a validation service at the time of signing and acts as proof that at the time of signing the certificate is valid. This is useful because even when the certificate expires or is revoked at a later time, the signature in the signed document remains valid.

Embedding revocation information is optional but suggested when applying advanced or qualified electronic signatures.

This option is not supported by all cryptographic providers and never for document timestamp signatures. For these cases, [-dss](#) must be used.

Revocation information is embedded for the signing certificate and all certificates of its trust chain. This implies that both OCSP responses and CRLs can be present in the same message.

The downsides of embedding revocation information are the increase of the file size (normally by around 20 KB) and that it requires a connection to a validation service, which delays the process of signing. For mass signing, it is suggested to use the caching mechanism, see [Caching of CRLs, OCSP, and timestamp responses](#).

Embedding revocation information requires an online connection to the CA that issues them. The firewall must be configured accordingly. In case a [web proxy](#) is used, it must be ensured the following MIME types are supported when using OCSP (not required for CRL):

application/ocsp-request

application/ocsp-request

9.2.22 -cp Cryptographic provider

Cryptographic provider -cp <prov>
License feature: **Signature**

This property specifies the cryptographic provider used to create and verify signatures.

For more information on the different providers available, see [Cryptographic provider](#).

- When using the [Windows Cryptographic Provider](#), the value of this property is set to a string with the following syntax:
"[ProviderType:]Provider[;PIN]"
If the name of the provider is omitted, the default provider is used.

Examples: "123456" being the PIN code

```
Provider = "Microsoft Base Cryptographic Provider v1.0;123456"
```

```
Provider = ";123456"
```

- When using the [PKCS#11 provider](#), the value of this property is set to a string with the following syntax:
"PathToDll;SlotId;Pin"

Example:

```
Provider = "\\WINDOWS\\system32\\siecap11.dll;4;123456"
```

- When using any of the service providers, such as the "Swisscom All-in signing service", the value of this property is essentially the URL of the service endpoint:
"http[s]://server.servicedomain.com:8080/url"

9.2.23 -cpf Cryptographic session property (file)

Cryptographic session property (file) -cpf <name> <file>

File data property for configuring cryptographic session. The supported names and values are specific to the cryptographic provider.

9.2.24 -cps Cryptographic session property (string)

Cryptographic session property (string) -cps <name> <str>

String property for configuring cryptographic session. The supported names and values are specific to the cryptographic provider.

9.2.25 -cr Signature reason

Signature reason -cr <reason>

Add a descriptive text about the reason why the document was signed.

Example: Sign the document and add a reason text.

```
pdfsecure -cn "Philip Renggli" -cr "Review and approval" -ar 10 10 200 50 ^
```

```
input.pdf output.pdf
```

The signature of the resulting output looks as shown below:

9.2.26 -csl Certificate store location

Certificate store location -csl <location>

For the [Windows Cryptographic Provider](#), this defines the location of the certificate store from where the signing certificate should be taken. Supported are:

- 0 Local Machine.
- 1 Current User (default).

For more information, see [Windows Cryptographic Provider](#).

9.2.27 -csn Certificate store name

Certificate store name -csn <store>

For the [Windows Cryptographic Provider](#), this defines the certificate store from where the signing certificate should be taken. This depends on the operating system. The default is "MY". Other supported values are: "CA" or "ROOT".

Example: Use the certificate store ROOT from the Local Machine account.

```
pdfsecure -cn "..." -csn ROOT -csl 0 input.pdf output.pdf
```

9.2.28 -dap Document access permissions for DocMDP signature

Document access permissions for DocMDP signature -dap <p>

This option controls the type of permitted modifications to a certified document. Valid values are:

- 1 No changes to the document are permitted; any change to the document invalidates the signature (default).
- 2 Permitted changes are filling in forms, instantiating page templates, and signing; other changes invalidate the signature.
- 3 Permitted changes are the same as for 2, as well as annotation creation, deletion, and modification; other changes invalidate the signature.

9.2.29 -dss Add signature validation information to the document's DSS

Add signature validation information to the document's DSS -dss

License feature: **Signature**

Add signature validation information to the document security store (DSS). This information includes:

1. All certificates of the signing certificate's trust chain, unless they are already embedded into the signature.
2. Revocation data (OCSP or CRL) for all certificates that support revocation information.

Validation information for embedded timestamp tokens is added as well.

This requires a [Cryptographic provider](#), which has been specified using `-cp`. All types of cryptographic providers support this method. However, this method fails when using a provider whose certificate store is missing a required certificate. Because providers of digital signature services do not have a certificate store, it is recommended that you use either the PKCS#11 or the Windows Cryptographic provider.

This method can be used to create signatures with long-term validation material or to enlarge the longevity of existing signatures. See section [Creating a PAdES signature](#) for more information.

Note: This method does not validate the signatures, but only downloads the information required.

Note: Adding validation information for expired certificates is not possible. Therefore, it is crucial to enlarge the longevity of signatures before they expire.

9.2.30 -dts Create a timestamp signature

Create a timestamp signature -dts

License feature: **Signature**

Add a document-level timestamp. No appearance is created. The following signature option must be set: `-tsu`. The following signature options may be set: `-cp`, `-tsc`, `-wpu`, `-wpc`.

9.2.31 -fs Force signature

Force signature -fs

Force signature allows DocMDP (PDF 1.6) and timestamp signatures (PDF 2.0) on PDF/A-1 documents. The output file's version is upgraded and PDF/A conformance is removed. So the output file contains the signature, but is not PDF/A-1 anymore.

Applying a DocMDP or timestamp signature breaks PDF/A-1 conformance. Therefore, the default behavior is to abort the operation with an error.

9.2.32 -mdp Create a DocMDP signature

Create a DocMDP signature -mdp

License feature: **Signature**

This option creates a DocMDP (document modification detection and prevention) signature instead of a document signature. The DocMDP signature is also referred to as “certify a document”.

Note: This version can create visible DocMDP signatures. In order to create an invisible signature, set the signature’s rectangle as follows: `-ar 0 0 0 0`.

9.2.33 -nc Disable cache for CRL and OCSP

Disable cache for CRL and OCSP -nc

Get or set whether to disable the cache for CRL and OCSP responses.

Using the cache is safe, since the responses are cached as long as they are valid only. The option affects both signature creation and validation.

See [Caching of CRLs, OCSP, and timestamp responses](#) for more information on the caches.

9.2.34 -nd Disable the use of DSS when signing documents

Disable the use of DSS when signing documents -nd

Use this option to avoid embedding revocation information (OCSP, CRL, and trust chain) in the document security store (DSS) when signing documents. This is to work around issues with legacy software that does not support the DSS. The use of the DSS is recommended for long-term (LTV) signatures.

9.2.35 -p2f Replace placeholder image with signature field

Replace placeholder image with signature field -p2f

License feature: **Signature**

This option enables the replacement of special placeholder images with signature fields that can later be signed (e.g. with Adobe Acrobat or the 3-Heights® PDF Security Shell). This function is used to automatically place signature fields under the control of the creator program.

The following image must be used as placeholder: [signature-placeholder.png](#).

9.2.36 -rs Remove signatures

Remove signatures -rs <flags>

License feature: **Signature**

This option can be used to remove signatures and unsigned signature fields.

Valid flags are:

- s** Remove signatures (i.e. signed signature fields). All fields and associated information are removed.
- u** Remove unsigned signature fields. If the input file is signed and signed signature fields are not removed, this operation is performed as an incremental update. Thereby, signed fields and their respective file revisions are preserved. This enables the recovery of unsigned signature fields contained in these revisions.

- a Remove all signature fields, i.e. both signed and unsigned.

9.2.37 -vs Verify signature

Verify signature -vs

License feature: **Signature**

This option verifies all signatures in the input document. Get more information on the signatures by using the option **-v**.

For more information on validating digital signature, see [Validating digital signatures](#).

9.2.38 -spc Create signature preview

Create signature preview -spc

License feature: **Signature**

Create a signature preview. See [Creating a preview of a signed document](#) for a description of the process.

9.2.39 -sps Sign signature preview

Sign signature preview -sps

License feature: **Signature**

Sign a signature preview file that has previously been created using the option **-spc**.

9.2.40 -st Set signature subfilter

Set signature subfilter -st <subfilter>

The <subfilter> indicates the encoding of the signature. The following are common values for <subfilter>:

adbe.pkcs7.detached (PDF 1.6) Legacy PAdES Basic (ETSI TS 102 778, Part 2) signature used for document signatures and DocMDP signatures (**-mdp**).

ETSI.CAdES.detached (PDF 2.0) PAdES signature as specified by European Norm ETSI EN 319 142. This type is used for document signatures and DocMDP signatures (**-mdp**). See [Creating a PAdES signature](#) for more information.

9.2.41 -tsc Timestamp credentials

Timestamp credentials -tsc <cred>

If a timestamp server requires authentication, use this switch to provide the credentials.

Example: Credentials commonly have the syntax `username:password`.

```
pdfsecure -cn "... " -tsu http://mytimestamp.com -tsc username:password
```

```
input.pdf output.pdf
```

9.2.42 -tsu Timestamp URL

Timestamp URL -tsu <url>

The URL of the trusted timestamp server (TSA) from which a timestamp is acquired. This setting is only required when applying a Qualified Electronic Signature. Applying a timestamp requires an online connection to a timestamp server; the firewall must be configured accordingly. In case a web proxy is used, it must be ensured the following MIME types are supported:

application/timestamp-query

application/timestamp-reply

9.2.43 -wpc Web proxy server credentials

Web proxy server credentials -wpc <cred>

If a web proxy server is used, and it requires authentication, use this switch and the syntax `user:password`.

Example: Set a web proxy server URL and use authentication.

```
pdfsecure -wpu "http://proxy.example.org" -wpc user:password input.pdf
output.pdf
```

9.2.44 -wpu Web proxy server URL

Web proxy server URL -wpu <url>

In an organization where a web proxy server is in use, it must be ensured this web proxy server is specified. The URL is something like `"http://proxy.example.org"` or an IP address. For more information, see [Using a proxy](#).

9.3 Object hasher

See [Object hasher](#) for more information on the object hashing feature.

9.3.1 -h Calculate object hashes

Calculate object hashes -h <algorithm> <file>

Parameters:

<algorithm> The hashing algorithm to use: "SHA-256", "SHA-512", "SHA-1", or "MD5"

<file> Path to the XML output file.

Calculate the object hashes using the hashing algorithm `<algorithm>` and writing the result to the XML file `<file>`.

9.3.2 -vh Verify object hashes

Verify object hashes -vh `<file>`

Parameter:

`<file>` Path to the XML file containing the hashes of the reference file.

Compare the hashes of the input file to the ones from the reference file `<file>`.

9.4 General switches

9.4.1 -id Set value in the document information dictionary

Set value in the document information dictionary -id `<key>` `<value>`

Set the value of an document information dictionary entry `<key>`. Popular entries specified in the [PDF Reference 1.7](#) are "Title", "Author", "Subject", "Creator" (sometimes referred to as Application), and "Producer" (sometimes referred to as PDF Creator). If the entry already exists then the previous entry is overwritten. If the key corresponds to a standard metadata key, then the XMP metadata is updated accordingly.

Example: Overwrite the default producer:

```
pdfsecure -id Producer "MyProgram 1.2" input.pdf output.pdf
```

9.4.2 -ax Add XMP metadata

Add XMP metadata -ax `<file>`

Add XMP metadata from a file. Providing a path that does not exist or an invalid XMP file results in return code 3.

```
pdfsecure -ax metadata.xml input.pdf output.pdf
```

The following metadata properties may be modified by the 3-Heights® PDF Security Shell:

- `pdf:Producer`, `xmp:ModifyDate`, and `xmp:MetadataDate`
- Properties from the PDF/A Identification (pdfaid) schema and `pdf:PDFVersion`
- Keys set using option `-id` override the corresponding values in the XMP metadata stream

9.4.3 -lk Set license key

Set license key -lk `<key>`

Pass a license key to the application at runtime, instead of using one that is installed on the system.

```
pdfsecure -lk X-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX-XXXXX ...
```

This is required in an OEM scenario only.

9.4.4 -ow Optimize for the web

Optimize for the web -ow

Note: This option has no effect when combined with [-owa](#).

Note: With this option enabled, non-Latin characters in the output file name are not supported.

Linearize the PDF output file, i.e. optimize file for fast web access.

The 3-Heights® PDF Security Shell does not support linearization of PDF 2.0 documents. For such documents, processing fails. In order to automatically disable linearization for PDF 2.0 use [-owa](#).

A linearized document has a slightly larger file size than a non-linearized file and provides the following main features:

- When a document is opened in a PDF viewer of a web browser, the first page can be viewed without downloading the entire PDF file. In contrast, a non-linearized PDF file must be downloaded completely before the first page can be displayed.
- When another page is requested by the user, that page is displayed as quickly as possible and incrementally as data arrives, without downloading the entire PDF file.

The above applies only if the PDF viewer supports fast viewing of linearized PDFs.

Note: To use a linearized PDF file, the PDF must reside as a “file” on the web server. It must not be streamed.

When enabling this option, then no PDF objects are stored in object streams in the output PDF. For certain input documents, this can lead to a significant increase of file size.

9.4.5 -owa Optimize for the Web automatically

Optimize for the Web automatically -owa

Note: With this option enabled, non-Latin characters in the output file name are not supported.

Automatically decide whether to linearize the PDF output file for fast web access.

Applying linearization can lead to a large increase in file size for certain documents. Enabling this option lets the 3-Heights® PDF Security Shell automatically apply linearization or refrain from doing so based on the estimated file size increase.

With this option enabled, PDF 2.0 documents are automatically excluded from linearization.

See also [-ow](#) for more information for linearized PDFs.

Note: When `-owa` is given, then the `-ow` option has no effect.

9.4.6 -s Add stamps

Add stamps `-s <file>`

License feature: **Stamping**

Add a stamp XML file. For more information about stamping, see [Stamping](#).

9.4.7 -rls Remove legacy stamps

Remove legacy stamps `-rls`

License feature: **Stamping**

Remove stamps created by the PDF Batch Stamp Tool (`pdstamp`). The stamps must be removable, i.e. they must have previously been added using the `-e` option. Also, after adding removable stamps, the document must not be modified, because this may make the removal of stamps impossible.

Stamps cannot be removed from signed documents, because this would break the signatures. Trying to do so results in an error. If breaking the signature is acceptable, they must be removed using the `-rs` option.

This option can be used in combination with other options, e.g. `-s` to add new stamps or options to sign or encrypt the result.

9.4.8 -v Verbose mode

Verbose mode `-v`

This option turns on the verbose mode.

In the verbose mode, the steps performed by 3-Heights® PDF Security Shell are written to standard output.

Example: Enable the verbose mode

```
pdfsecure -v input.pdf output.pdf
Processing file input.pdf
Done.
```

9.5 Frequent error source

It may happen that you type a command, or copy it from somewhere and it doesn't work even though it seems to be correct. A common reason is that the dash (`-`), which is used for most parameters, is accidentally mistaken by an em dash (`—`).

9.6 Tracing

The 3-Heights® PDF Security Shell contains tracing functionality that logs runtime information to a file. No confidential data, such as the content of processed files or passwords, are traced. The tracing functionality is designed to provide useful information to Pdftools's support team for support requests. Tracing is not active by default and can be activated by the customer under the guidance of the support team. Nonetheless, activating tracing and sharing the information is optional and there is no obligation to do so.

9.7 Return codes

All return codes other than 0 indicate an error in the processing.

Return codes

Value	Description
0	Success.
1	Couldn't open input file.
2	PDF output file could not be created.
3	Error with given options, e.g. too many parameters.
4	PDF input file is encrypted and password is missing or incorrect.
5	Extraction error either due to corrupt input PDF or failure when storing an extracted file.
5	Cannot create or remove signature.
6	Cannot get response from CRL, OCSP, or Timestamp server.
7	Input file contains invalid signatures (validation).
8	Stamping warning occurred.
10	License error, e.g. invalid license key.

Possible reasons for return code 5 are:

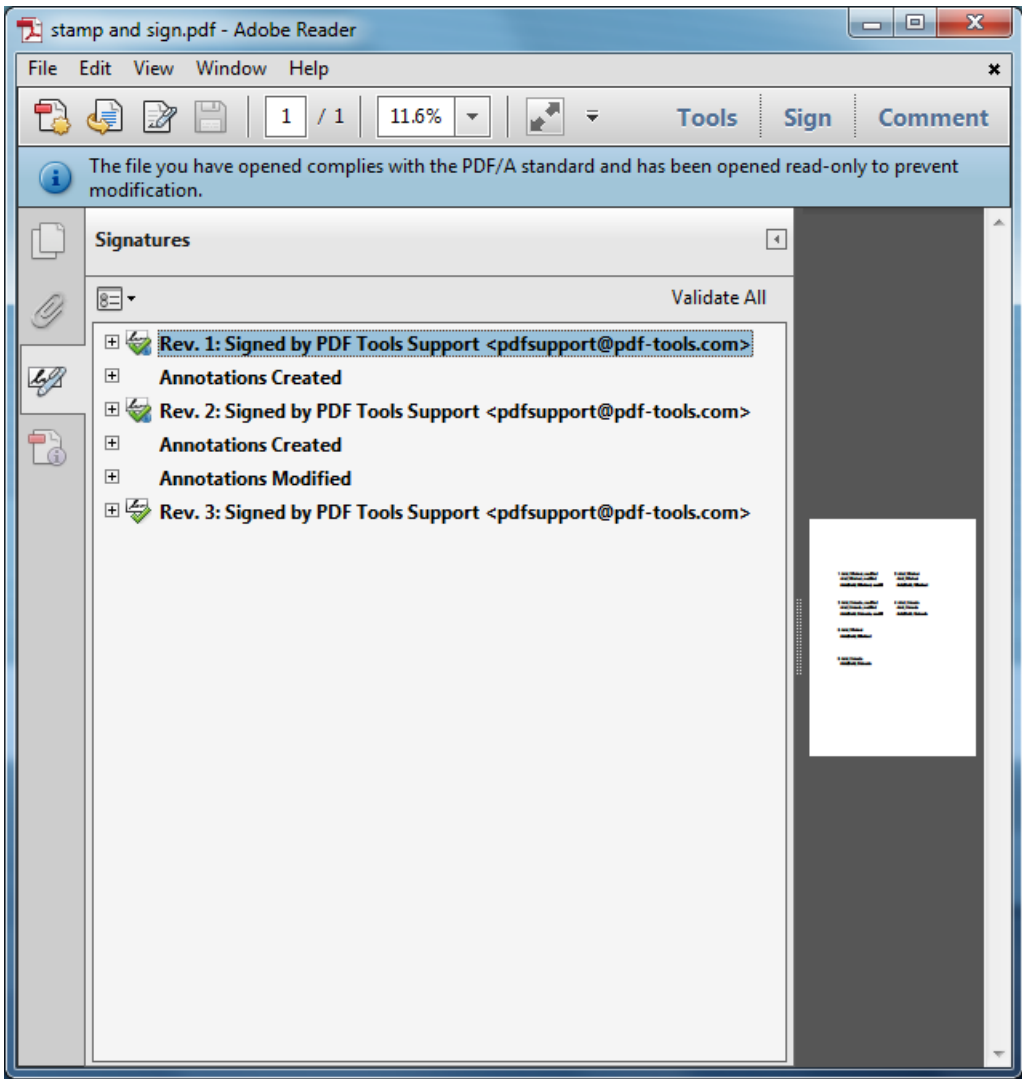

- Cannot create a session (or CSP).
- The certificate store is not available.
- The certificate cannot be found.
- The private key is not available.
- Incorrect signature length.

Use [-v](#) in order to get a more detailed error message.

10 Stamping

The 3-Heights® PDF Security Shell can add new content such as text or images to the output document. This process is called stamping. The content of previously applied stamps can be modified.

The 3-Heights® PDF Security Shell can sign and stamp documents in one step. To not invalidate existing signatures, stamps can be modified and created using stamp annotations with an incremental update to the input document. An example of this can be seen in the screenshot below.

10.1 Stamp file syntax

Stamps are described with XML data that is passed to the 3-Heights® PDF Security Shell as file using the option `-s`. A stamp file can contain one or more stamps.

For each **Tag** there is a separate table below, where the **Attribute-Names** and the **Attribute-Values** are described.

<pdfstamp>

The **Root Tag** for the PDF stamp XML file. The tag may contain multiple stamps.

`xmlns="http://www.pdf-tools.com/pdfstamp/"` (required)

XML namespace used for all stamp elements.

10.1.1 Stamp

A stamp is defined by a `<stamp>` tag that specifies the stamp's size, position, and pages to which it is applied to. The stamp's appearance is defined by the content operators contained therein.

`<stamp>` Add a Stamp

`page="<page_set>"` (required)

The pages to which the stamp is to be applied. The syntax is as follows:

```
<page_set> = <page_range> [", " <page_range>]
<page_range> = <n> | <n1>-<n2> | first | last | not_first | not_last | even
| odd | all
```

Where:

- `<n>`, `<n1>`, `<n2>`: Page number. `1` defines the first page.
The prefix `^` can be used to count from the end of the document. For example, `^1` specifies the last and `^2` the second to last page.
- `first`: First page
- `last`: Last page
- `odd`: Only odd pages including first page and last page in case it is odd
- `even`: Only even pages including last page in case it is even
- `all`: All pages
- `not_first`: First page excluded
- `not_last`: Last page excluded

Example: `page="1,2-4,6,10,last"`

`name="<identifier>"` (optional)

Unique identifier of the stamp, must be less than 127 characters, see section [Modify content of existing stamps](#) for more information.

`relativepos="<x> <y>"` (required)

Relative position `<x>` and `<y>` of the stamp with regards to the page. Positive values of `<x>` and `<y>` define the distances of the stamp to the left and lower, negative values to the right and upper page boundary respectively. The units of the values are PDF units of 1/72 inch. The positioning algorithm works best for stamp rotation angles that are a multiple of 90° (see `rotate` attribute).

`<x>` or `<y>` are ignored, if respective `align` is used.

Examples:

1. `relativepos=" 10 -10"` places the stamp in the upper left corner of the page.
2. `relativepos="-10 -10"` places the stamp in the upper right corner of the page.
3. `relativepos=" 10 10"` places the stamp in the lower left corner of the page.
4. `relativepos="-10 10"` places the stamp in the lower right corner of the page.

`align="<alignment>"` (optional)

Align the stamp with the page. Allowed values for `<alignment>` are:

- `center`: position horizontally at center of page, the `<x>` value of `relativepos` is ignored.
- `middle`: position vertically at middle of page, the `<y>` value of `relativepos` is ignored.
- `transverse`: position stamp in the middle of the page and rotate it, such that it aligns with the diagonal of the page from the lower left to the upper right corner. Note that `transverse` cannot be used in combination with the attributes `relativepos` and `rotate`.

Examples:

1. `<stamp position="0 4" align="center">`
Centers the stamp horizontally and 4 pt away from the bottom of the page.
2. `<stamp position="-4 0" align="middle">`
Centers the stamp vertically and 4 pt away from the right edge of the page.

size="`<w> <h>`" (optional)

The width and height of the stamp. The stamp's content will be clipped to this rectangle. If this is not specified or either `<w>` or `<h>` are zero, the respective size is calculated to fit content.

rotate="`<angle>`" (optional)

Rotation of the stamp in degrees clockwise.

scale="`<scale_set>`" (optional)

Modify scale of stamp. Allowed values for `<scale_set>` are:

- **relToA4**: Scale the stamp relative to the page size. For example, make stamp half as large on an A5 and twice as large on an A3 page as specified.
- **shrinkRelToA4**: Shrink stamp for all pages smaller than A4. For example, on A5 make stamp half as large as specified and as specified an A3 page.

autoorientation="``" (optional)

Allowed values for `` are:

- **false** (default): Always position stamps as defined by stamp attributes.
- **true**: Detect orientation (portrait and landscape) of page automatically and treat landscape page as 90° rotated portrait. Useful to apply stamps to "long" or "short" edge of page.

alpha="`<ca>`" (optional)

The opacity of the stamp as a whole. **1.0** for fully opaque, **0.0** for fully transparent.

Default: **1.0**

The PDF/A-1 standard does not allow transparency. Therefore, for PDF/A-1 conforming input files you must not set alpha to a value other than **1.0**.

type="`<type>`" (optional)

The type of the stamp

- **annotation** (default): The stamp is added to the page as a stamp annotation. Creating or modifying stamps of this type will not invalidate existing signatures of the input document. While it is not easily possible to remove stamps of this type, it is possible to print a document without annotations.
- **foreground**¹²: The stamp is added to the foreground of the page content. Creating or modifying stamps of this type will invalidate all existing signatures of the input document. It is not easily possible to remove stamps of this type nor can the document be printed without them.
- **background**: The stamp is added to the background of the page content. Creating or modifying stamps of this type will invalidate all existing signatures of the input document. It is not easily possible to remove stamps of this type nor can the document be printed without them.
Note that stamps placed this way can be hidden when pages contain a non-transparent background. In these cases, you may rather want to put the stamps in the foreground, but apply alpha transparency to achieve a result with existing content not covered completely.

flags="`<flags>`" (optional)

Set the flags of the stamp annotation (i.e. stamps with `type="annotation"`). `<flags>` is a comma separated list of the following values: **NoView**, **Print**, **ReadOnly**, and **Locked**. See chapter 8.4.2 "Annotation Flags" of the [PDF Reference 1.7](#) for a description of the flags.

For PDF/A conformance, the flag **Print** must be set and **NoView** must not be set.

Default: **Print**, **ReadOnly**, **Locked**

layer="**<name>**" (optional)

Set the name of the layer that can be used by the consumer to selectively view or hide the stamp. If the attribute is omitted or its value is empty, no layer is used so the stamp is always visible.

For input documents that already contain a layer of the specified name the document's existing layer is used. Otherwise, a new layer is created. The new layer is visible by default and inserted at the end of the document's list of layers.

Default: no layer

The PDF/A-1 standard does not allow layers. Therefore, for PDF/A-1 conforming input files you must not set the attribute **layer**. In order to preserve the conformance of PDF/A-1 input documents, the 3-Heights® PDF Security Shell will not create layers and indicate a stamping warning using the return code 8 (see [Return codes](#)).

Coordinates

All coordinate and size values are in PDF units of 1/72 inch (A4 = 595 x 842 points, letter = 612 x 792 points). The origin of the coordinate system is generally the lower left corner of the reference object. For stamps the reference object is the page, for content operators the reference is the stamp rectangle.

Modify content of existing stamps

Setting the **name** attribute of a stamp allows the stamp's content to be replaced later. If an existing stamp with the same name exists in the input file, its content is replaced as shown in example [Example 2: Modify "Simple Stamp"](#). Note that when updating a stamp, its pageset, position and size cannot be changed. Therefore, if you intend to update a stamp, make sure to create it specifying a **size** that is sufficiently large.

When modifying a stamp, only its content may be changed. All attributes of **<stamp>** must remain unchanged, in particular **page**, **size** and **type**.

10.1.2 Stamp content

Each stamp contains a number of content operators that define the appearance (i.e. the content) of the stamp. The content operators are applied in the order they appear within **<stamp>** where each content element is drawn over all previous elements (i.e. increasing z-order).

Text

Stamp text is defined by **<text>**. All character data (text) therein is stamped:

```
<text font="Arial" size="12">Some text</text>
```

Text fragments can be formatted differently by enclosing them in a **** element. All text formatting attributes are inherited from the parent element and can be overridden in ****:

```
<text font="Arial" size="12" >Text with a <span
```

¹² Up to version 4.5.6.0 of the 3-Heights® PDF Security Shell this type was called **content**.

```
font="Arial,Bold">bold</span> and a <span  
color="1 0 0">red</span> word.</text>
```

Note that all character data in `<text>` is added, including whitespace such as spaces and line breaks.

`<text>` Add Text

All text formatting attributes described in `` can also be specified in `<text>`.

position="`<x>` `<y>`" (optional)

The position in points within the stamp, e.g. "200 300".

With the default values for **align** (**align**="left top"), **position** defines the top left corner of the text¹³.

align="`<xalign>` `<yalign>`" (optional)

Align text at **position** or stamp, if **position** is not set.

Values for horizontal alignment `<xalign>`:

- **left**: align to the left (**default**)
- **center**: center text
- **right**: align to the right

Values for vertical alignment `<yalign>`:

- **top**: align to the top (**default**)
- **middle**: align to the middle
- **bottom**: align to the bottom

Examples:

1. `<text align="left bottom" ...>`
positions the text in the left bottom corner of the stamp.
2. `<text align="left bottom" position="10 10" ...>`:
align left bottom corner of text to position "10 10".

format="``" (optional)

Whether or not to enable formatting of variable text. Allowed values for `` are **true** and **false** (**default**). See [Variable text](#) for more information.

text="`<text>`" (optional)

The text that is to be written, e.g. `text="Hello World"`.

Multi-line text is supported by using the newline character `
`, e.g. `text="1st line
2nd line"`.

If the attribute **text** is not specified, the text content of `<text>` is used. So `<text ... text="Hello World"/>` produces the same result as `<text ...>Hello World</text>`.

`` Define Formatting of Text

Example: `<text font="Arial" size="8">Note: Text can be formatted using .</text>`

color="`<r>` `<g>` ``" (optional)

The color as RGB value, where all values must be in the range from 0 to 1, e.g.:

- Red: "1 0 0"
- Green: "0 1 0"

¹³ Prior to version 4.4.31.0 of the 3-Heights® PDF Security Shell, **position** specified the origin of the first character. When upgrading, add `0.75*size` to the value of `<y>`.

- Yellow: "1 1 0"
- Black: "0 0 0" (default)
- Gray: "0.5 0.5 0.5"

font="<name>" (required)

The TrueType name of the font, e.g. "Arial" or "Times New Roman,Bold", or a complete path to the font, e.g. "C:\Windows\Fonts\Arial.ttf".

TrueType names consist of a font family name, which is optionally followed by a comma and style, e.g. "Verdana,Italic". Commonly available styles are "Bold", "Italic", and "BoldItalic". The respective font must be available in any of the font directories (see [Fonts](#)).

size="<n>" (required)

The font size in points, e.g. 12.

If set to 0 or auto, the size is chosen such that text fits the stamp's size. This is only allowed under these conditions:

- The <text> element is not within a transformation operator.
- The stamp has a fixed size. It can either be defined by the attribute size or from updating an existing stamp.
- If the text's attribute position is set, the position must be inside the stamp's size.

fontencoding="<encoding>" (optional)

This attribute is relevant only, if the stamp will be modified later (see section [Modify content of existing stamps](#)).

The PDF/A standard demands that all used fonts must be embedded in the PDF. Since fonts with many glyphs can be very large in size (>20MB), unused glyphs are removed prior to embedding. This process is called subsetting. The value <encoding> controls the subsetting and must be one of the following:

- **Unicode: (default)** Only the glyphs used by the stamp are embedded. If the stamp is modified, a new font that includes the new glyph set has to be re-embedded. This setting is recommended for stamps that will not be modified later.
- **WinAnsi:** All glyphs required for WinAnsiEncoding are embedded. Hence the text's characters are limited to this character set. If the content of the stamp is updated, fonts using WinAnsi will be reused.

For example, embedding the font Arial with Unicode and approximately ten glyphs uses 20KB while Arial with WinAnsi (approximately 200 glyphs) uses 53KB of font data.

mode="<modes>" (optional)

The attribute mode controls the rendering mode of the text.

Allowed values for <modes> are the following or a combination thereof:

- **fill: (default)** The text is filled.
- **stroke:** The text's outlines are stroked. The width of the stroke is specified by linewidth.

linewidth="<f>" (optional)

Set the line width in points, e.g. 1.0 (default).

decoration="<decorations>" (optional)

The attribute decoration can be used to add any of the following text decorations:

- **underline:** A small line is drawn below the text.

<link> Create Link

For all text contained within this element, a link is created. Links work best for stamps with type="foreground", but are possible for other types as well.

Example: `<text font="Arial" size="8">@ <link uri="https://www.pdf-tools.com/"
> Pdftools – PDF Tools AG</link></text>`

uri="<uri>" (required)

The URI which is the link target.

<filltext> Obsolete tag.

Starting with version 4.9.1.0 of the 3-Heights® PDF Security Shell the element `<filltext ...>` was rendered obsolete by `<text ...>`.

<stroketext> Obsolete tag.

Starting with version 4.9.1.0 of the 3-Heights® PDF Security Shell the element `<stroketext ...>` was rendered obsolete by `<text mode="stroke" ...>`.

Variable text

Variable text such as the current date or the number of pages can be stamped in `<text>`. The feature must be activated by setting `format="true"`.

Variable text elements are of the following form:

`"{<value>:<format>}"`

The `<value>` defines the type of value. `<format>` is optional and specifies how the value should be formatted. To stamp the `{` character, it must be escaped by duplicating it: `{{`.

String values

<value> The following values are supported:

- **Title**: the document's title
- **Author**: the name of the person who created the document
- **Subject**: the subject of the document
- **Creator**: the original application that created the document
- **Producer**: the application that created the PDF

Example: Stamp the document author.

Text	Result
Author: {Author}	Author: Peter Pan

Date values

<value> The following values are supported:

- **UTC**: the current time in UTC
- **LocalTime**: the current local time
- **CreationDate**: the date and time the document was originally created
- **ModDate**: the date and time the document was most recently modified

<format> The default format is a locale-dependent date and time representation. Alternatively a format string as accepted by `strftime()` can be specified.

Example: Stamp the current local time with the default format.

Text	Result
Received: {LocalTime}	Received: Thu Aug 23 14:55:02 2001

Example: Stamp the current date.

Text	Result
Date: {LocalTime:%d. %m. %Y}	Date: 23. 8. 2011

Number values

<value> The following values are supported:

- **PageNumber**: the page number. Note that when updating the content of an existing stamp as described in [Modify content of existing stamps](#), the new content can only contain **PageNumber** if the existing stamp also used **PageNumber**.
- **PageCount**: the number of pages in the document

Optionally, an offset can be appended to the **<value>**, where positive offsets start with **+** and negative with **-**. For example **{PageCount+2}** to add or **{PageCount-2}** to subtract 2 from the actual page count.

<format> Optionally a format string as accepted by `printf()` can be specified.

Example: Stamp the page count.

Text	Result
{{PageCount}} = {PageCount}	{PageCount} = 10

Example: Stamp the current date and time onto each page's lower right corner.

```
<?xml version="1.0" encoding="utf-8"?>
<pdfstamp xmlns="http://www.pdf-tools.com/pdfstamp/">
  <stamp page="all" relativepos="-10 10">
    <text font="Arial" size="10" format="true">Date: {LocalTime}</text>
  </stamp>
</pdfstamp>
```

Images and geometric shapes

<image> Add Image

rect="<x> <y> <w> <h>" (required)

The rectangle where the image is to be placed at. **<x>** and **<y>** correspond to the location (lower left corner), and **<w>** and **<h>** to width and height of the image, e.g. **100 200 50 50**

src="<url>" (required)

The URL or path to the file¹⁴, e.g. **C:/pictures/image1.jpg** or **http://www.mydomain.com/image1.jpg**.

¹⁴ Prior to version 4.10.13.0 of the 3-Heights® PDF Security Shell, this attribute was called **filename**.

compression="**<value>**" (optional)

By default, bitonal images are compressed with **CCITTFax**, continuous tone images with **DCT** and indexed images with **Flate**. To explicitly set the compression, use this property.

Supported values are:

- **Flate**: Flate encoded
- **DCT**: DCT (JPEG) encoded
- **CCITTFax**: CCITT G4 encoded

<fillrectangle> Add Filled Rectangle

rect="**<x>** **<y>** **<w>** **<h>**" (optional)

The coordinates and size of the rectangle. If this value is omitted, the rectangle fills the entire area of the stamp.

color="**<r>** **<g>** ****" (optional)

The fill color of the rectangle. The color as RGB value, where all values must be in the range from **0.0** to **1.0**. The default is black: "**0 0 0**"

alpha="**<ca>**" (optional)

The opacity of the rectangle. **1.0** for fully opaque, **0.0** for fully transparent.

Default: **1.0**

The PDF/A-1 standard does not allow transparency. Therefore, for PDF/A-1 conforming input files you must not set alpha to a value other than **1.0**.

<strokerectangle> Add Stroked Rectangle

linewidth="**<f>**" (optional)

Set the line width in points, e.g. **1.0** (default).

For the following parameter descriptions see [<fillrectangle>](#).

rect="**<x>** **<y>** **<w>** **<h>**"

color="**<r>** **<g>** ****"

alpha="**<ca>**"

Transformations

The transform operators apply to stamp content defined within the tag. For example, this can be used to rotate **<text>** or **<image>**.

<rotate> Rotation

angle="**<n>**" (required)

Rotate by **<n>** degrees counter-clockwise, e.g. **90**

origin="**<x>** **<y>**" (required)

Set the origin of the rotation in points, e.g. **100 100**

<translate> Coordinate Translation

offset="**<x>** **<y>**" (required)

The **<x>** (horizontal) and **<y>** (vertical) offset in points. A translation by **x y** is equal to a transformation by **1 0 0 1 x y**.

<transform> Coordinate Transformation

matrix="**<a> <c> <d> <x> <y>**" (required)

The transformation matrix to scale, rotate, skew, or translate.

Examples:

1. Identity: **1 0 0 1 0 0**
2. Scale by factor 2 (double size): **2 0 0 2 0 0**
3. Translate 50 points to left, 200 up: **1 0 0 1 50 200**
4. Rotate by **x**: **cos(x) sin(x) -sin(x) cos(x) 0 0**
For 90° (= $\pi/2$) that is: **0 1 -1 0 0 0**

10.2 Examples

10.2.1 Example 1: Simple stamps

Apply two simple stamps.

First stamp: Stamp text "Simple Stamp" on in upper left corner of all pages.

Second stamp: Stamp image `lena.tif` rotated by 90° and located at the center of the top corner of the first page.

example1.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<pdfstamp xmlns="http://www.pdf-tools.com/pdfstamp/">

  <stamp page="all" name="simple stamp"
    relativepos="10 -10" size="160 0">
    <text align="left middle"
      font="Arial" size="20" fontencoding="WinAnsi"
      text="Simple Stamp" />
  </stamp>

  <stamp page="first"
    relativepos="0 -10" align="center">
    <rotate angle="90" origin="50 50">
      <image rect="0 0 100 100"
        filename="C:\images\lena.tif"/>
    </rotate>
  </stamp>

</pdfstamp>
```

3-Heights™
PDF Security API

Version 4.8.24.0

PDF-TOOLS.COM
Premium PDF Technology

Result of [example1.xml](#).

10.2.2 Example 2: Modify "Simple Stamp"

Modify "simple stamp" from [Example 1: Simple stamps](#).

The stamp "**simple stamp**" can be modified by applying the following stamp XML file to the output file of the example above. Note that since position and size of the stamp remain unchanged, the respective attributes can be omitted.

The second stamp applied in [Example 1](#) is not modified.

example2.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<pdfstamp xmlns="http://www.pdf-tools.com/pdfstamp/">
  <stamp name="simple stamp">
    <text align="left middle"
      color="1 0 0"
      font="Arial" size="20" fontencoding="WinAnsi"
      text="Modified Stamp" />
  </stamp>
</pdfstamp>
```

Result of [example2.xml](#).

10.2.3 Example 3: Add watermark text diagonally across pages

The stamp is specified for an A4 page. On each page the stamp is applied to, it is scaled (**scale**="relToA4") and rotated (**align**="transverse") to fit the page.

example3.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<pdfstamp xmlns="http://www.pdf-tools.com/pdfstamp/">
  <stamp page="all"
    scale="relToA4"
    align="transverse"
    type="foreground">
    <text mode="stroke"
      font="Arial,Bold" size="60"
      >WATERMARK TEXT</text>
  </stamp>
</pdfstamp>
```

Result of [example3.xml](#).

10.2.4 Example 4: Apply stamp to long edge of all pages

Stamp has a light gray background and a black border.

example4.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<pdfstamp xmlns="http://www.pdf-tools.com/pdfstamp/">
  <stamp page="all" size="802 28"
    relativepos="5 0" align="middle" rotate="90"
    scale="relToA4" autoorientation="true"
    alpha="0.75" type="foreground">
    <fillrectangle color="0.8 0.8 0.8"/>
    <stroke/rectangle/>
    <text align="center middle"
      font="Arial" size="20"
      text="stamp on long edge"/>
  </stamp>
</pdfstamp>
```

Result of [example4.xml](#).

10.2.5 Example 5: Stamp links

Stamp a list of links.

example5.xml:

```
<?xml version="1.0" encoding="utf-8"?>
<pdfstamp xmlns="http://www.pdf-tools.com/pdfstamp/">
  <stamp page="first" type="content" relativepos="-10 10" >
    <text font="MyriadPro" size="20" >Bookmarks:
  - <span color="0 0 1" decoration="underline"><link
      uri="http://www.pdf-tools.com/...">Product website</link></span>
  - <span color="0 0 1" decoration="underline"><link
      uri="http://www.pdf-tools.com/.../seca.pdf">Manual</link></span>
  - <span color="0 0 1" decoration="underline"><link
      uri="https://www.pdf-online.com/osa/secure.aspx">Online sample</link></span>
    </text>
  </stamp>
</pdfstamp>
```

Result of [example5.xml](#).

Version 4.8.24.0

Bookmarks:
- [Product website](#)
- [Manual](#)
- [Online sample](#)

11 Version history

11.1 Changes in versions 6.19–6.27

- **New** support for Elliptic Curve DSA (ECDSA) signature algorithms in the PKCS#11 Provider and Windows Cryptographic Provider.
- **New** support for PKCS#11 devices that contain private keys only.
- **Update** license agreement to version 2.9
- **Improved** auto font size feature for text stamping feature.

11.2 Changes in versions 6.13–6.18

- Stamping
 - **New** attribute `layer` of `<stamp>` to create stamp whose visibility can be controlled by layer.
 - **New** value `transverse` for attribute `align` of `<stamp>`.
 - **New** variable text element `PageNumber`.
 - **New** variable text elements for document metadata properties, e.g. `Author` or `Title`.
 - **New** prefix `^` for page numbers in attribute `page` of `<stamp>` to count from back of document.
- **New** option `-nd`.

11.3 Changes in versions 6.1–6.12

- Digital Signatures
 - Swisscom All-in Signing Service
 - **New** support for accounts (`Identity`) based on Swisscom CA 4 Certificate Authorities.
 - **New** support to create PAdES signatures (format `ETSI.CAdES.detached`).
 - **Improved** embedding of revocation information (OCSP, CRL, and trust chain) to always use the document security store (DSS)¹⁵.
 - **Changed** the creation of signatures of format `ETSI.CAdES.detached` to include revocation information if `-co` is not used and if supported by the cryptographic provider.
 - **Improved** support for new version of the GlobalSign Digital Signing Service. The service endpoint should be updated to `https://emea.api.dss.globalsign.com:8443/v2`.
- Stamping
 - **New** value `shrinkRelToA4` for attribute `flags` of `<stamp>`.
- **Improved** search algorithm for installed fonts: User fonts under Windows are now also taken into account.
- **New** option `-rls` to remove legacy stamps created by the PDF Batch Stamp Tool.

11.4 Changes in version 5

- Digital Signatures
 - **New** support to get CRLs using HTTPS and via HTTP redirection.
- **New** additional supported operating system: Windows Server 2019.
- **New** options `-atc1` and `-atc2` to set the color of the signature appearance's text.

¹⁵ Use the option `-nd` to restore the previous behavior.

11.5 Changes in version 4.12

- **Introduced** license features [Signature](#) and [Stamping](#).
- Digital Signatures
 - **New** support to sign OCSP requests, if required by the OCSP service.
 - **New** support for OCSP requests over HTTPS.
 - **Changed** acceptance criteria for OCSP responses that specify no validity interval (missing nextUpdate field, which is uncommon). Previously a validity interval of 24 hours has been used, now 5 minutes due to Adobe® Acrobat® compatibility.
- **New** support for encryption according to PDF 2.0 (revision 6, replaces deprecated revision 5).
- **Improved** reading and recovery of corrupt TIFF images.
- **New** HTTP proxy setting in the GUI license manager.
- **New** option [-owa](#) to automatically choose whether to linearize the output document or not.

11.6 Changes in version 4.11

- Digital Signatures
 - **New** support to create DocumentTimeStamp signatures using Swisscom All-in Signing Service.
 - **New** ability to sign documents that are larger than 2GB (64-bit version only).
- Stamping
 - **New** default compression Flate for PNG images.
- **New** support for reading and writing PDF 2.0 documents.
- **New** support for the creation of output files larger than 10GB (not PDF/A-1).
- **Improved** search in installed font collection to also find fonts by other names than TrueType or PostScript names.
- **New** treatment of the DocumentID. In contrast to the InstanceID the DocumentID of the output document is inherited from the input document.
- **Changed** option [-p](#): Added a new value `1` to adopt the encryption parameters from the input document.
- **New** option [-afn](#): to specify name of signature form field. This can be used to specify the name of a new form field or to sign an existing one.

11.7 Changes in version 4.10

- Digital signatures
 - **New** support for the new European PAdES norm (ETSI EN 319 142). See chapter “How to Create a PAdES Signature” in the user manual for more information.
 - **New** support for the GlobalSign Digital Signing Service as cryptographic provider to create signatures and timestamps.
 - **New** signature algorithm RSA with SSA-PSS (PKCS#1v2.1) can be chosen by setting the provider session property [SigAlgo](#).
 - **Improved** signature validation.
 - More signature formats supported, most notably the new European PAdES norm. The Windows cryptographic provider now supports the same formats as the PKCS#11 provider.
 - Support signature algorithm RSA with SSA-PSS (PKCS#1v2.1).
 - New and improved validation warnings.
 - Check for missing revocation information.
 - Use validation data embedded in the document security store (DSS).
 - **New** ability to add multiple signatures to encrypted files.
- Stamping

- **New** attribute `flags` of `<stamp>`, e.g. to create modifiable stamps or stamps that are only visible when printing.
- **New** attribute `src` of `<image>` allows a HTTP URL or file path.
- **New** ability to add or modify stamps of signed files that are also encrypted.
- **New** support for writing PDF objects into object streams. Most objects that are contained in object streams in the input document are now also stored in object streams in the output document. When enabling linearization, however, no objects are stored in object streams.
- **Improved** robustness against corrupt input PDF documents.
- **Changed** option `-vs`: The validation warning “No timestamp is present.” has been removed and replaced by a new column “timestamp authority”.
- **New** option `-dss`: Add signature validation information to the document. This option can be used to create signatures with long-term validation material or to enlarge the longevity of existing signatures.
- **New** option `-st` to set signature format, e.g. for new European PAdES norm.
- **New** options `-afs1` and `-afs2` to set font size of the signature appearance.

11.8 Changes in version 4.9

- **Improved** behavior: Before signing, missing appearance streams of form fields are created, because otherwise Adobe® Acrobat® cannot validate the signature.
- Stamping:
 - **New** tag `<link>` to add interactive web links.
 - **New** tag `<text>` allows to format spans in continuous text using nested `` tags.
- **Improved** support for and robustness against corrupt input PDF documents.
- **Improved** repair of embedded font programs that are corrupt.
- **New** support for OpenType font collections in installed font collection.
- **Improved** metadata generation for standard PDF properties.
- **New** option `-rs` to remove signature fields.
- **New** options `-spc` and `-sps` to create and sign signature preview documents.
- **New** options `-ss` and `-sf` to sign a documents using a signature created by an external cryptographic provider that provides the cryptographic signature as a file.

11.9 Changes in version 4.8

- **New** feature: Images used as signature appearance background or for stamping for PDF/A input files may now have any color space, even if it differs from the input file's output intent.
- **Improved** creation of annotation appearances to use less memory and processing time.
- **Added** repair functionality for TrueType font programs whose glyphs are not ordered correctly.
- **New** option `-h` to calculate hashes of different object sets of a PDF file.
- **New** option `-vh` to verify object hashes, i.e. detecting changes made to a PDF file.

12 Licensing, copyright, and contact

Pdftools (PDF Tools AG) is a world leader in PDF software, delivering reliable PDF products to international customers in all market segments.

Pdftools provides server-based software products designed specifically for developers, integrators, consultants, customizing specialists, and IT departments. Thousands of companies worldwide use our products directly and hundreds of thousands of users benefit from the technology indirectly via a global network of OEM partners. The tools can be easily embedded into application programs and are available for a multitude of operating system platforms.

Licensing and copyright The 3-Heights® PDF Security Shell is copyrighted. This user manual is also copyright protected; It may be copied and distributed provided that it remains unchanged including the copyright notice.
